Note: All observations are taken at 1200 G.c.t. Pressures and station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.c.t.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.- Langley is the unit used to denote one gram calorie per square centimeter.

Values with an asterisk are interpolated.

- Indicates Data Lost

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

MAY 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	91	181	185	270	194	251	199	254	275	277	201	112	62	148	269	263	138	87	130	122	189	167	167	58	57	185	49	221	252	53	118	168

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (· 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	18.94	22.14	14.08	9.70	12.55	19.89	17.52	16.81	13.14	11.12	18.82	19.77	21.54	19.41	23.32	20.12	20.83	17.99	22.61	19.53	18.94	13.97	18.35	20.12	13.49	22.49	10.18	22.49	14.20	16.45	16.45	17.64

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code ₛ Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code ₛ designates the type of measurement made

DESCRIPTION OF CHARTS

CHART I. A. NORMAL DAILY AVERAGE TEMPERATURE (°F. 1931-60) FOR MONTH. B. TEMPERATURE DEPARTURE FROM 30-YEAR MEAN (°F. 1931-60) FOR MONTH. Chart I-A is reproduced from Environmental Data Service Publication "Climatic Maps of the United States." Chart I-B is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin," a publication of Environmental Data Service.

CHART II. TOTAL PRECIPITATION. Chart II is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin."

CHART III. PERCENTAGE OF NORMAL PRECIPITATION. Chart III is a reproduction of monthly chart appearing in "Weekly Weather and Crop Bulletin."

CHART IV. TOTAL SNOWFALL. CHART V. A. PERCENTAGE OF MEAN MONTHLY SNOWFALL. B. DEPTH OF SNOW ON GROUND. Chart IV gives the total depth in inches of unmelted snowfall as reported during the month by Weather Service and selected cooperative stations. This is converted in Chart V-A into a percentage of the mean monthly total amount computed for each Weather Service station having at least 10 years of record. The depth of snow on ground is that reported by both Weather Service and selected cooperative stations as of 7:00 a.m., e.s.t., on the Monday nearest the end of the month. This is reported only for the months December through March. The snowfall charts are presented each month November through April.

Isolines for Charts I, II, III, IV, and V are drawn through points of approximately equal value. Caution should be used in interpolating on these charts, particularly in mountainous areas.

CHART VI. A. PERCENTAGE OF POSSIBLE SUNSHINE. B. PERCENTAGE OF MEAN MONTHLY SUNSHINE. Chart VI-A shows the amount of sunshine received in terms of percentage of the total hours of sunshine possible during the month. In Chart VI-B this is shown as a percentage of the mean number of hours of sunshine received. Means are computed for Weather Service stations having at least 10 years of record.

CHART VII . A. AVERAGE DAILY VALUES OF SOLAR RADIATION LANGLEYS. B. PERCENTAGE OF MEAN DAILY SOLAR RADIATION. Shown on Chart VII-A are the monthly averages of daily total solar radiation, both direct and diffuse, in langleys (gm. cal. cm.-2) for all Weather Service and selected cooperative stations which record this element. The analyses include adjustments required to bring station records to approximately the same level of calibration. Adjusted numbers are in parentheses. Chart VII-B shows the percentages of the mean based on at least 5 years of record during the period 1950-1960, and corrected to the International Pyrheliometer Scale of 1956.

CHART VIII. TRACKS OF CENTERS OF ANTICYCLONES AT SEA LEVEL.

CHART IX. TRACKS OF CENTERS OF CYCLONES AT SEA LEVEL. Centers which can be identified for 24 hours or more are tracked in these charts. Semipermanent features such as the Great Basin and Pacific Highs and Colorado and Mexico Lows are not shown. The 7:00 a.m., e.s.t., positions are shown by open circles, with the intermediate positions at 6-hour intervals shown by solid dots. The date is given above the circle and the central pressure to whole millibars below. A dashed track indicates a regeneration rather than actual movement to the next position. Solid squares indicate position of stationary center for period shown beside it.

CHART X. AVERAGE SEA LEVEL PRESSURE (mb.) AND RESULTANT SURFACE WIND. The average monthly sea level pressures are obtained from eight daily 3-hourly observations reported at Weather Service stations. Resultant surface wind directions (to 36 points of the compass) for the month are shown by arrows. Resultant speeds are in miles per hour and are indicated by the length of arrow shafts. Constancy ratios (resultant surface wind divided by average surface wind for month) are shown to two decimal places. The inset shows the departure of the average pressure based on 30-year normals for first-order Weather Service stations, other stations having at least 10 years of record; and for each 10° intersection in a diamond grid over the oceans.

CHARTS XI-XVI. AVERAGE HEIGHT, TEMPERATURE, AND RESULTANT WINDS, 850, 700, 500, 300, 200, and 100 mbs. Height is given in geopotential meters and temperature in degrees Celsius. These are the averages of the 1200 G.m.t. radiosonde reports. Wind speeds are given in meters per second; flag represents 25 m.p.s., full feather 5 m.p.s., and half feather 2-1/2 m.p.s. Directions are shown to 360° of the compass. Winds are based on rawins at the indicated pressure surface and at 1200 G.m.t.

CHART XVII. A. 50-MB. RESULTANT WINDS. B. 30-MB. RESULTANT WINDS. Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. Winds are based on rawins at the indicated pressure surface and at 1200 G.m.t.

Exact values of most of these charted elements for Weather Service stations are printed each month in tabular form in CLIMATOLOGICAL DATA, NATIONAL SUMMARY. Extreme values of temperature and precipitation for each State are included in the tables, Condensed Climatological Summary. Annual averages for surface elements are presented in the CDNS Annual Issue each year.

Chart 1. A. Normal Daily Average Temperature (°F 1931-60), July.

B. Temperature Departure from 30 - Year Mean (°F 1931-60), July 1971.

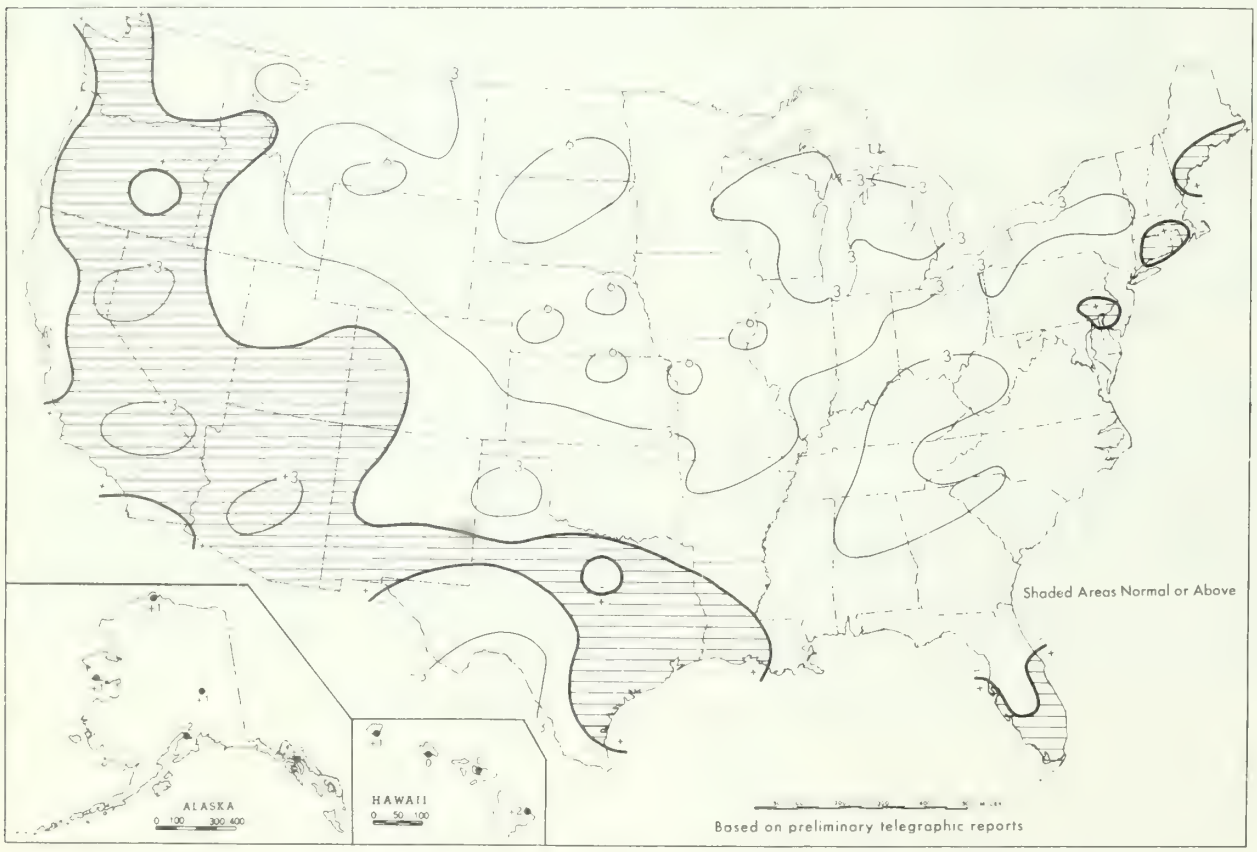

Chart II Total Precipitation (Inches), July 1971.

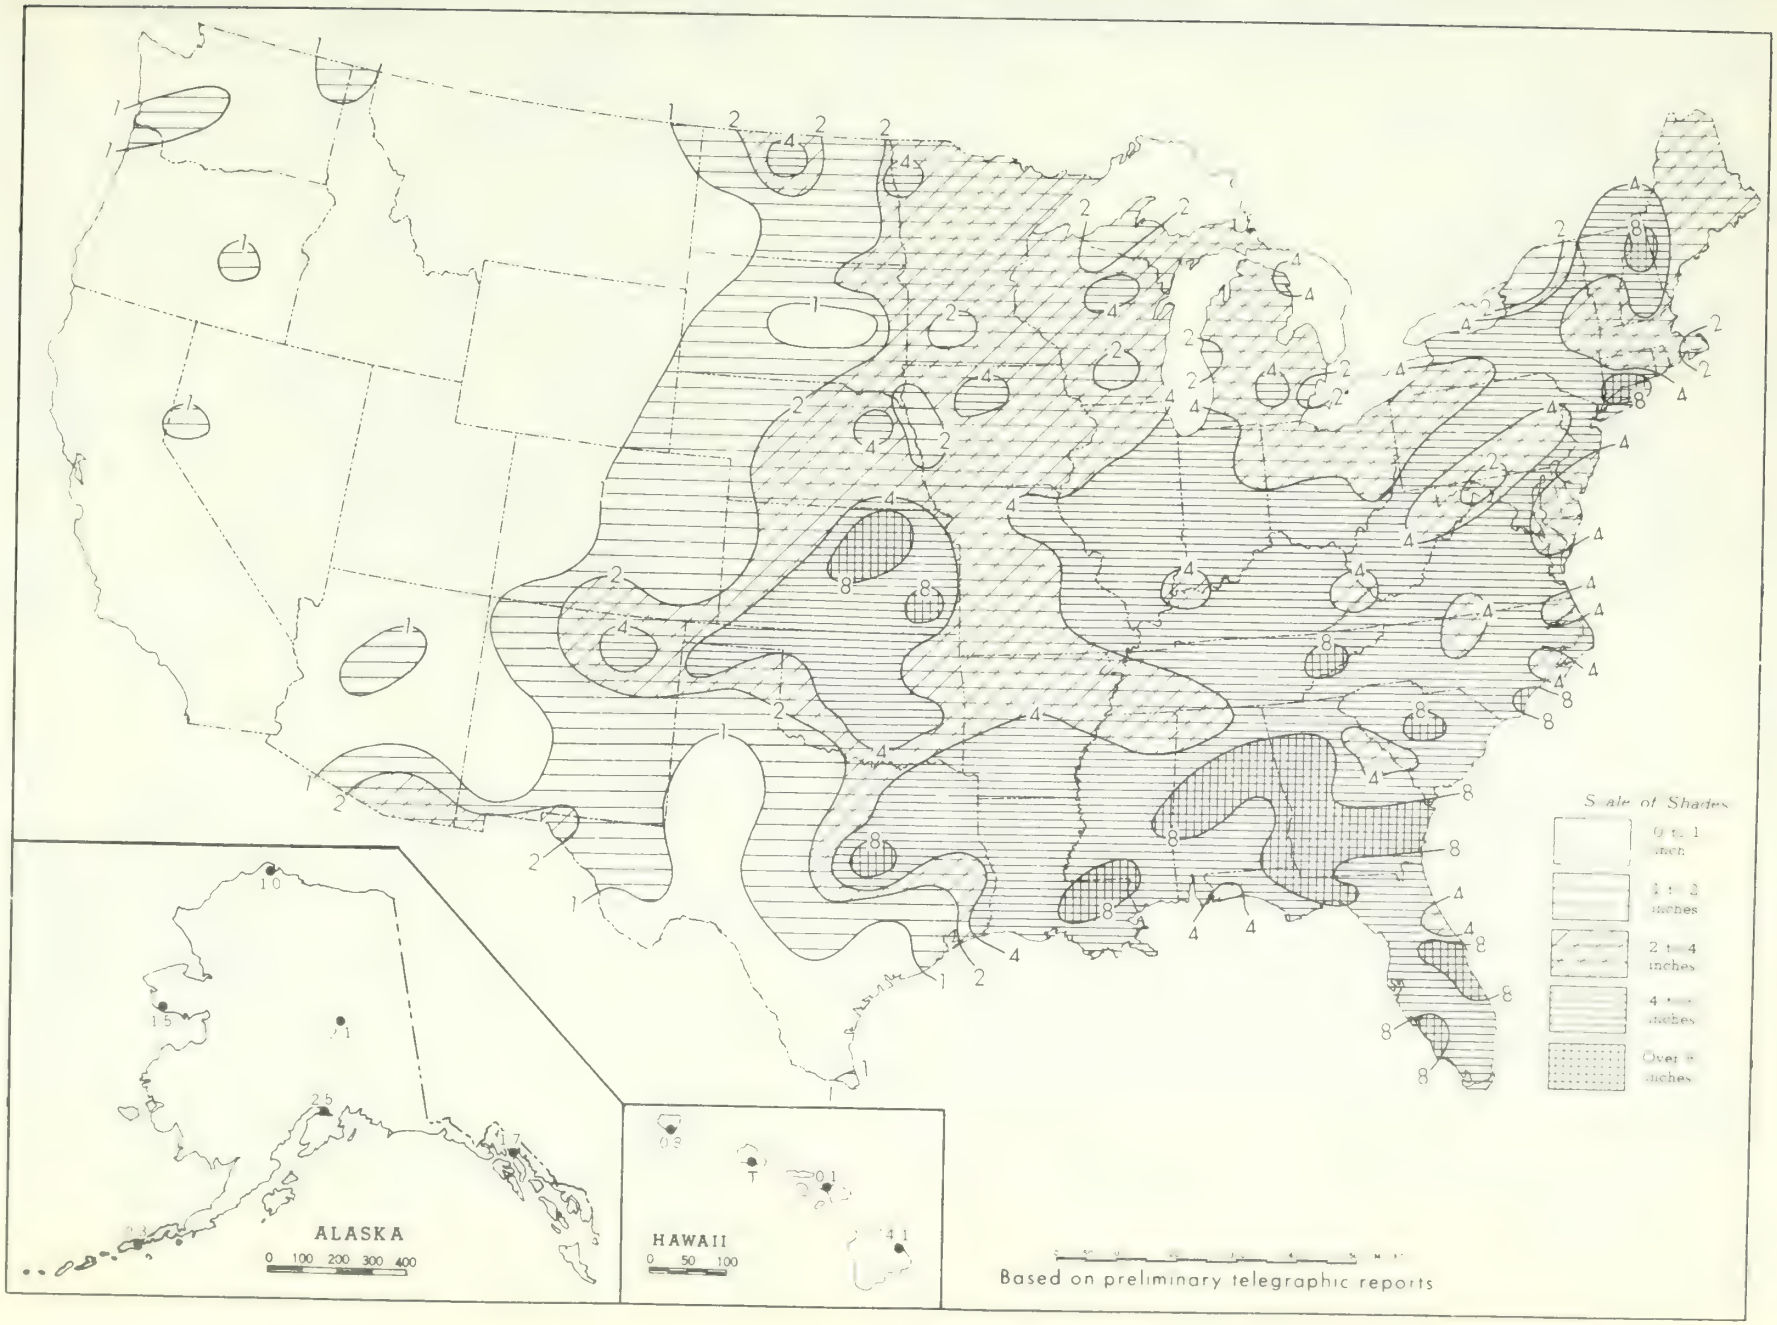

Chart III. Percentage of Normal Precipitation, July 1971.

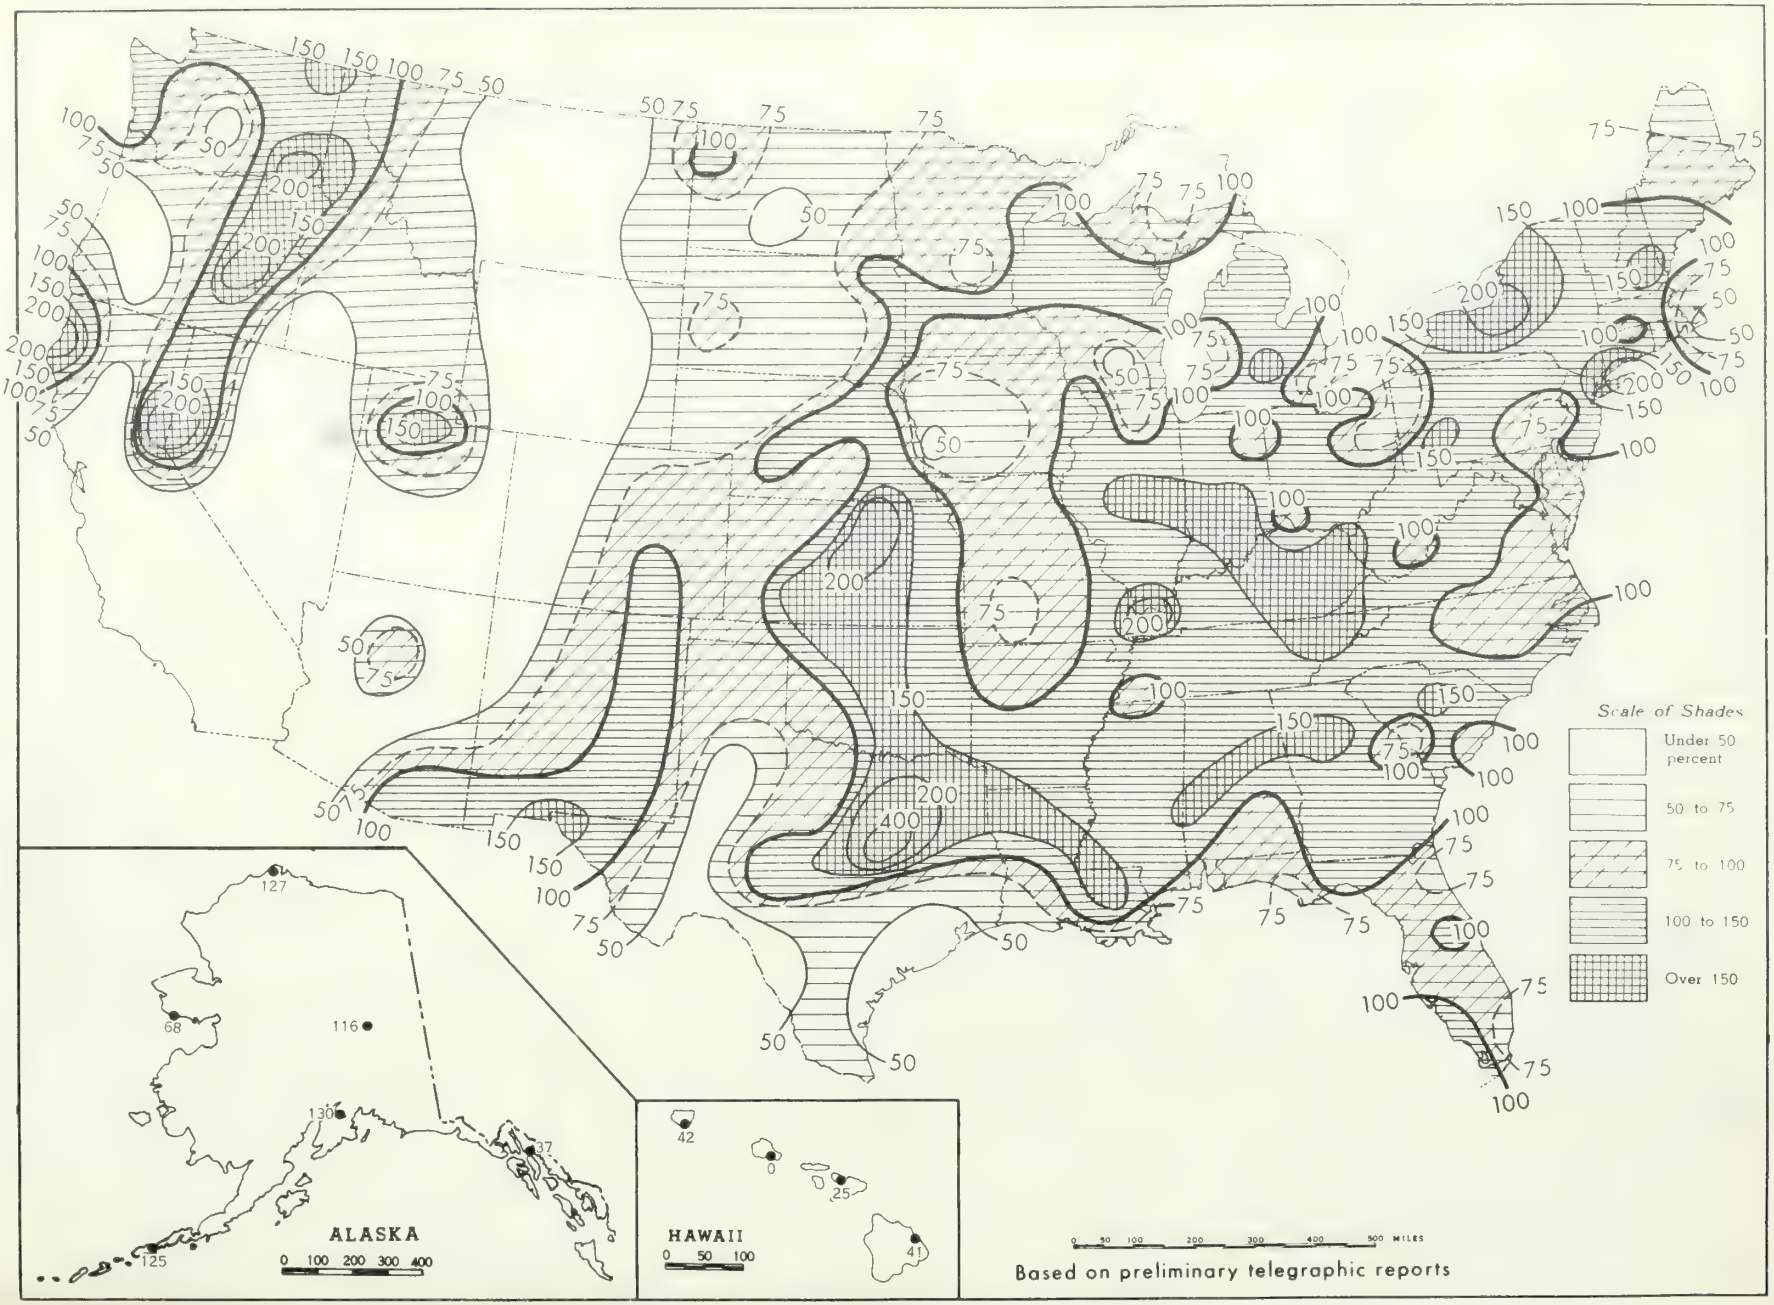

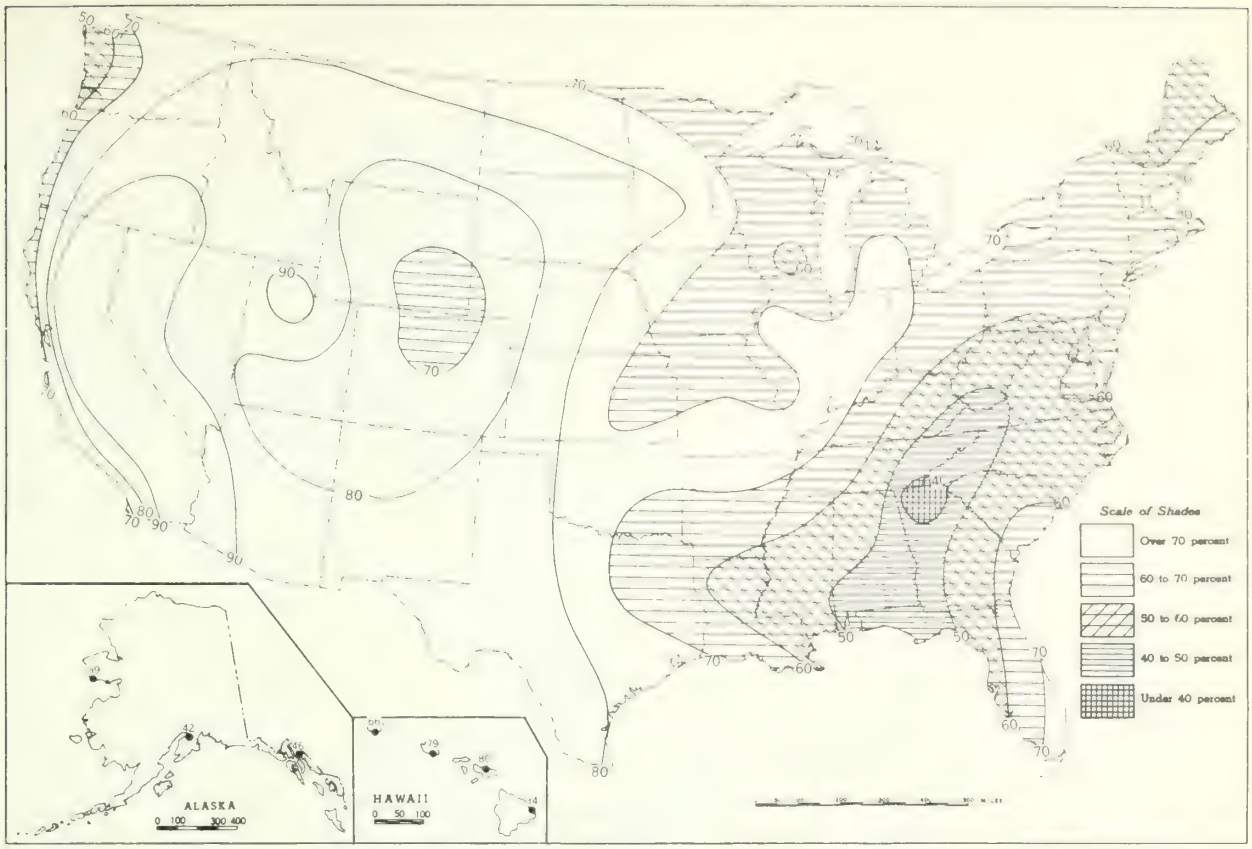

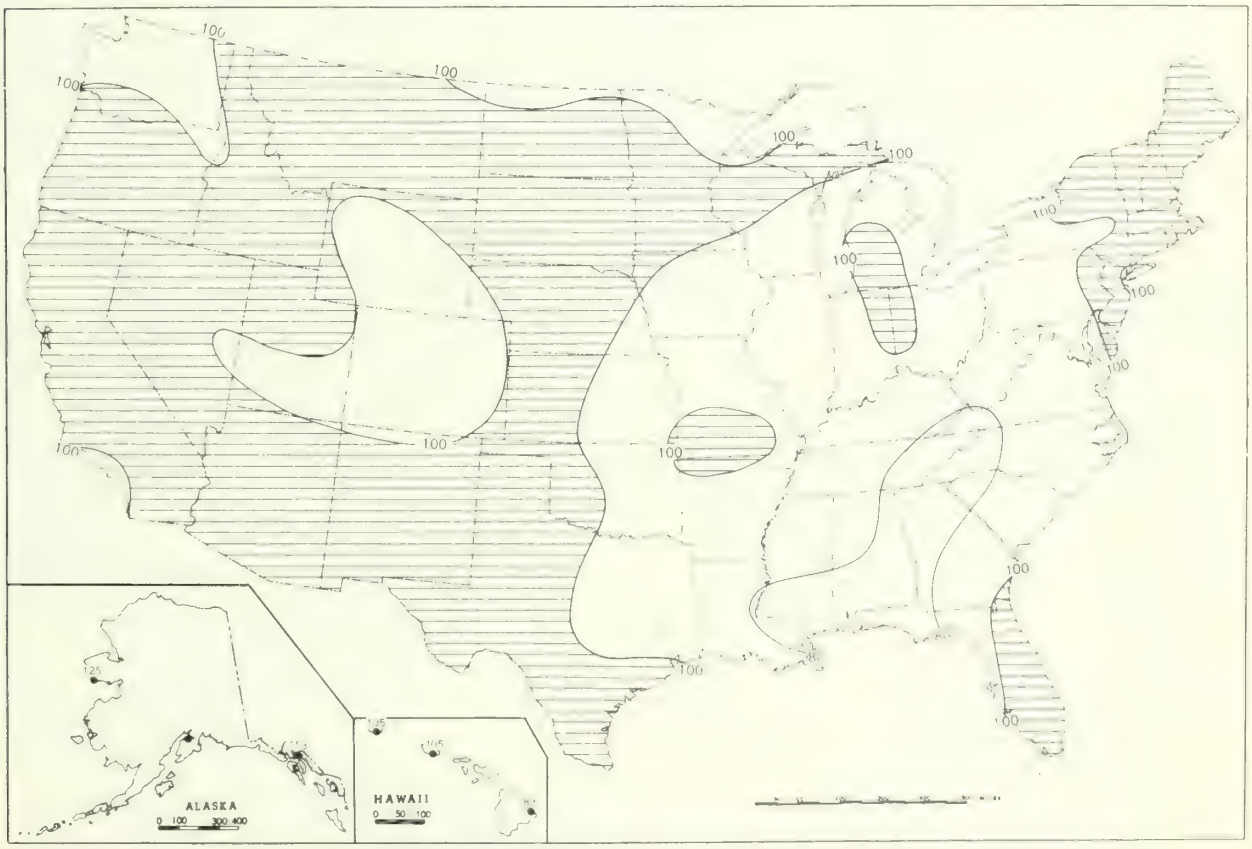

Chart VI. A. Percentage of Possible Sunshine, July 1971.

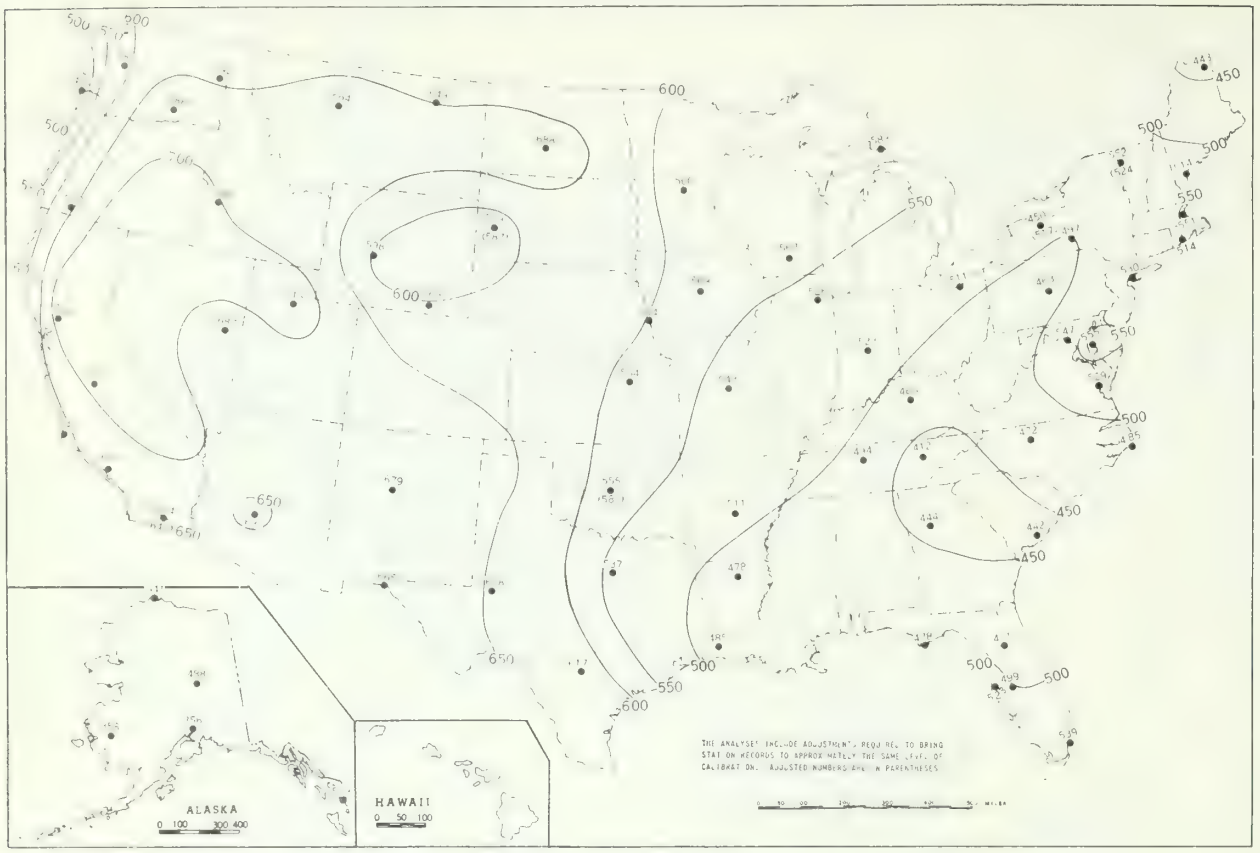
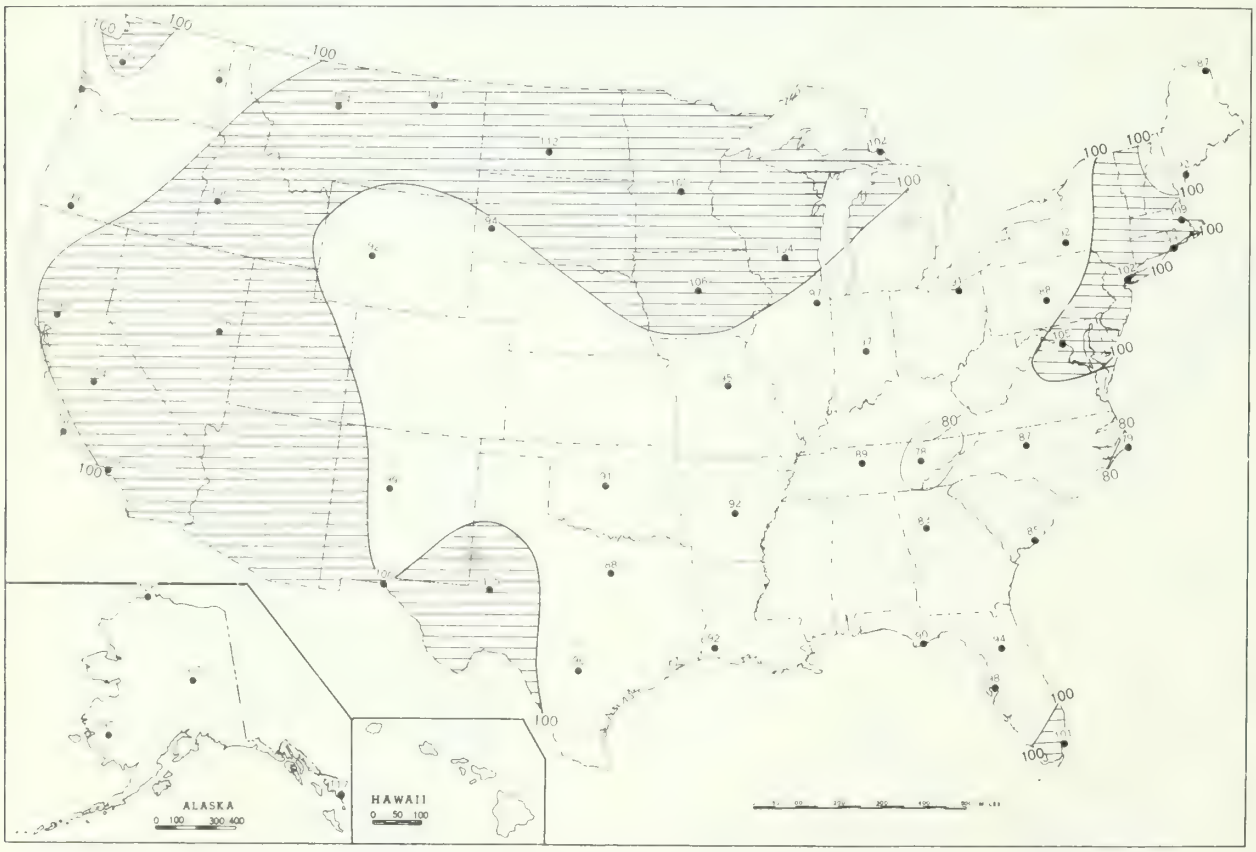
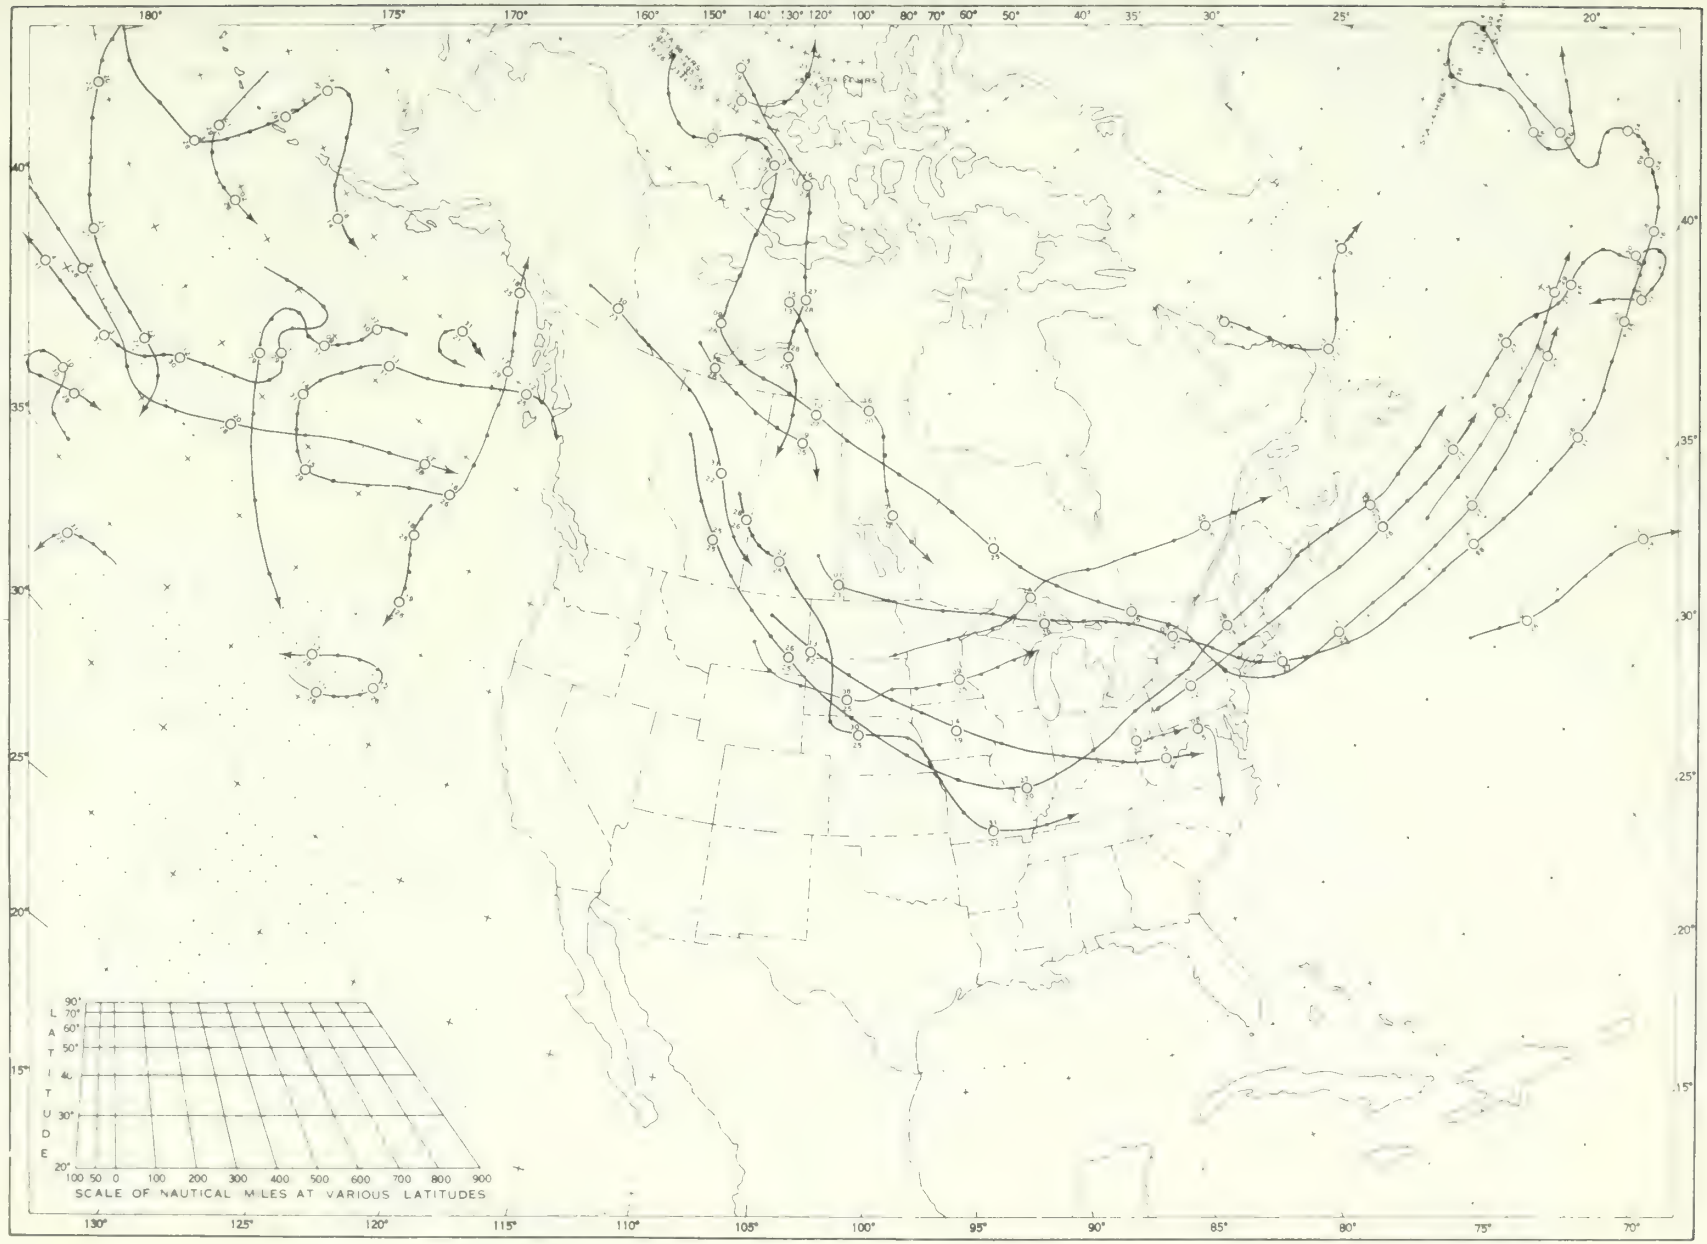


B. Percentage of Mean Monthly Sunshine, July 1971.

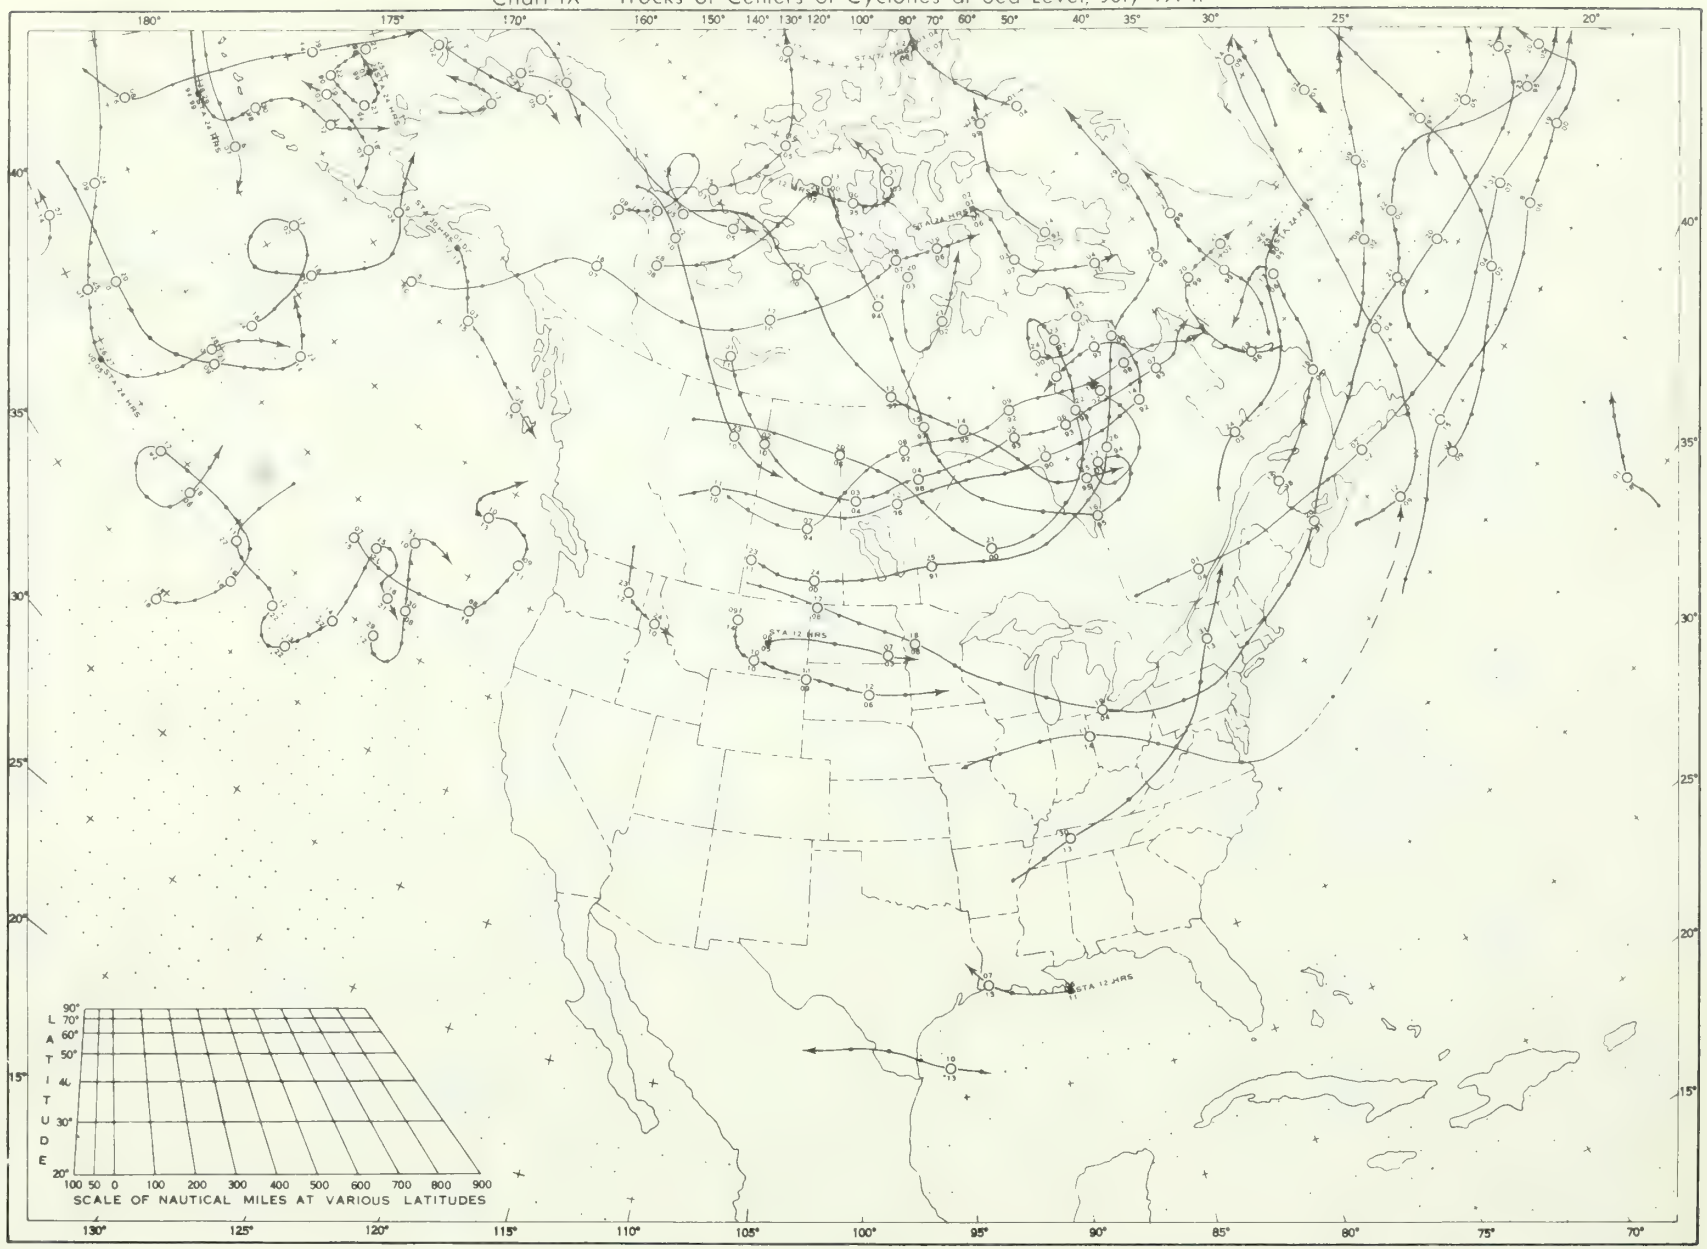


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, July 1971.

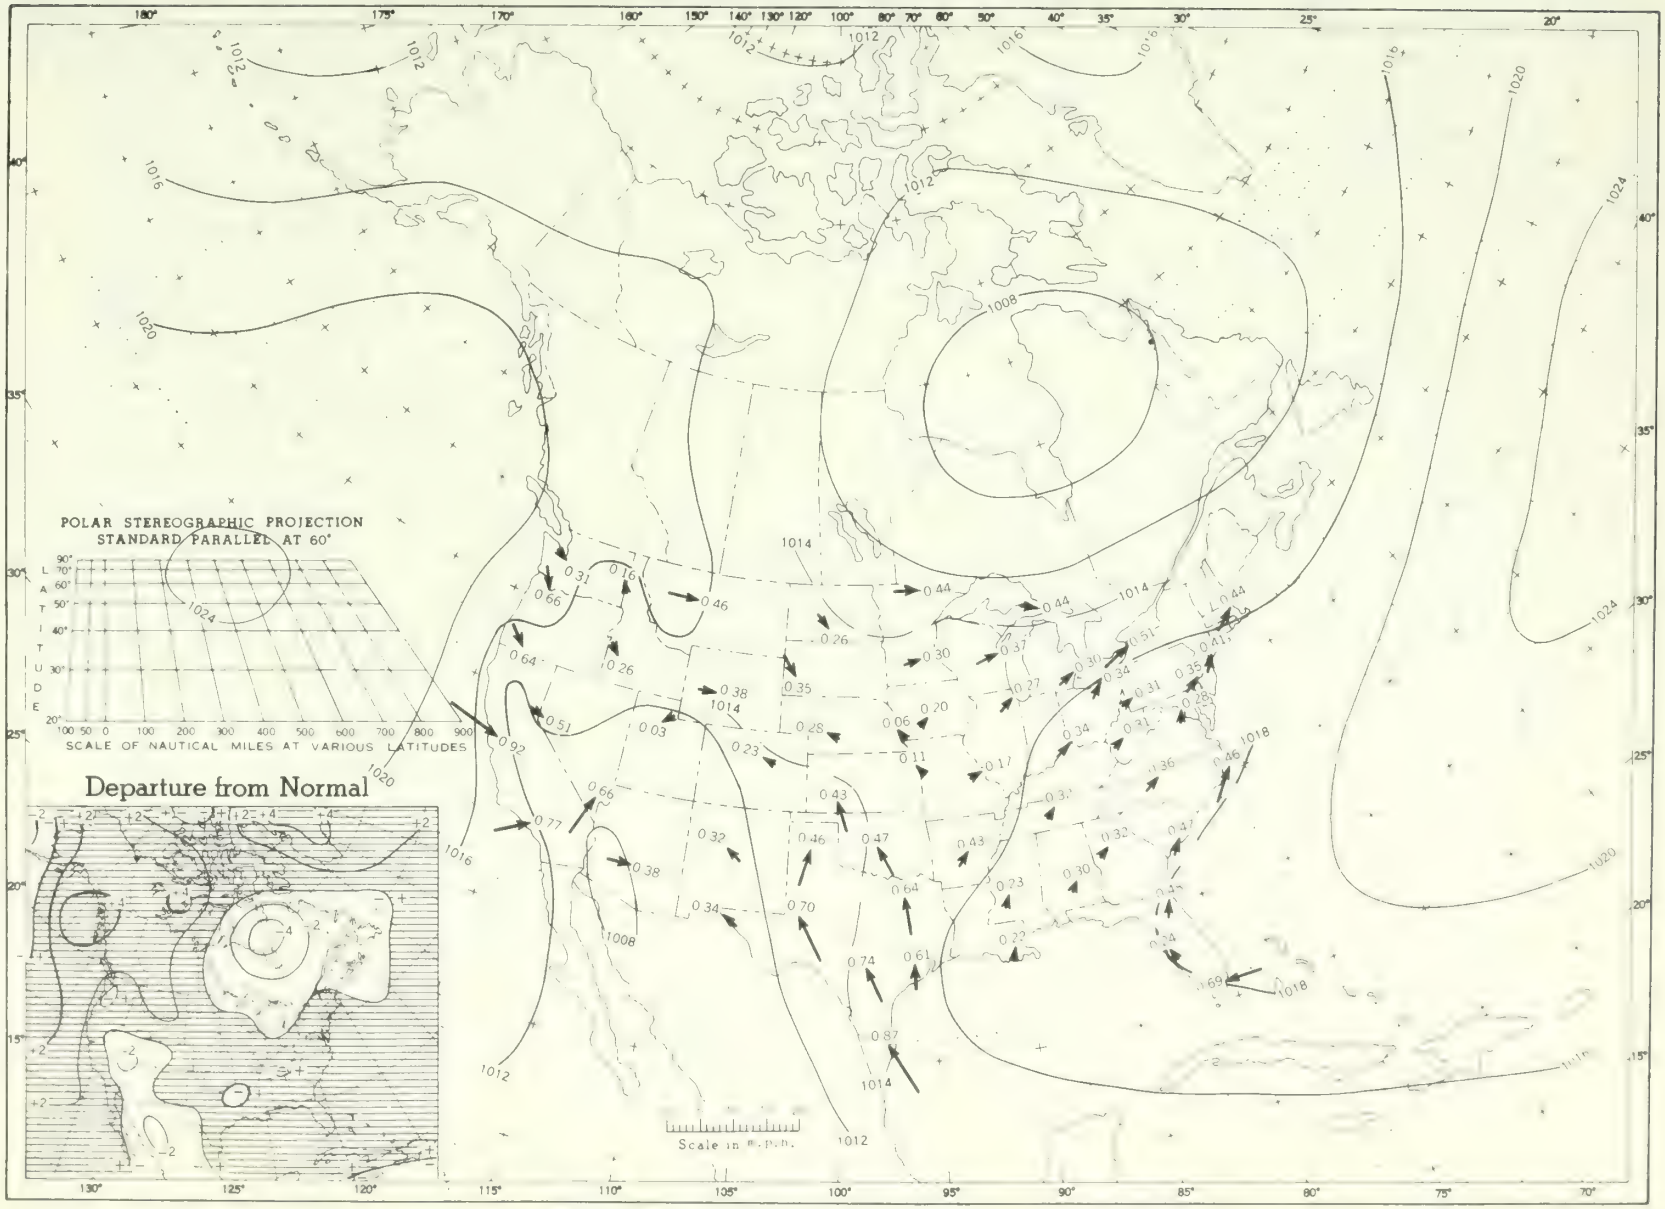


B. Percentage of Mean Daily Solar Radiation, July 1971.



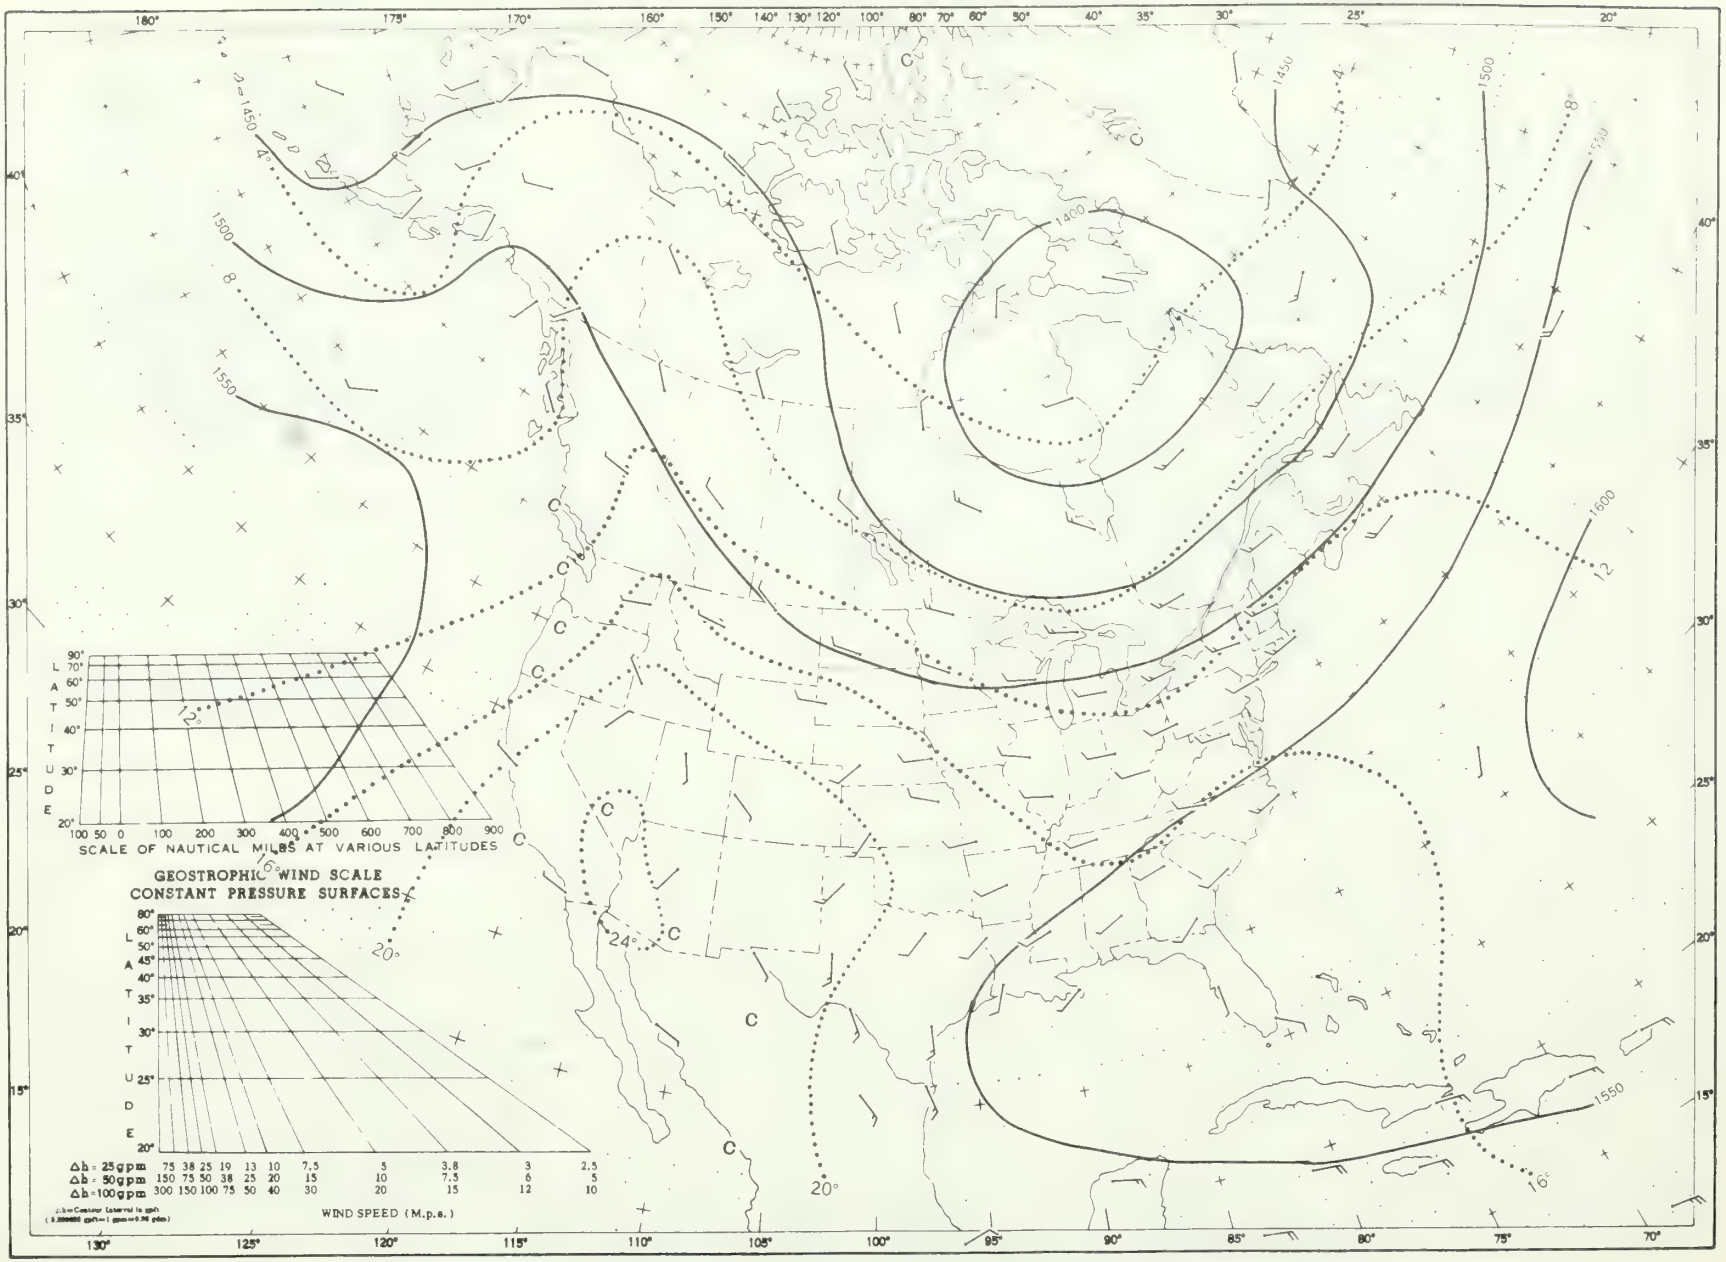
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, July 1971



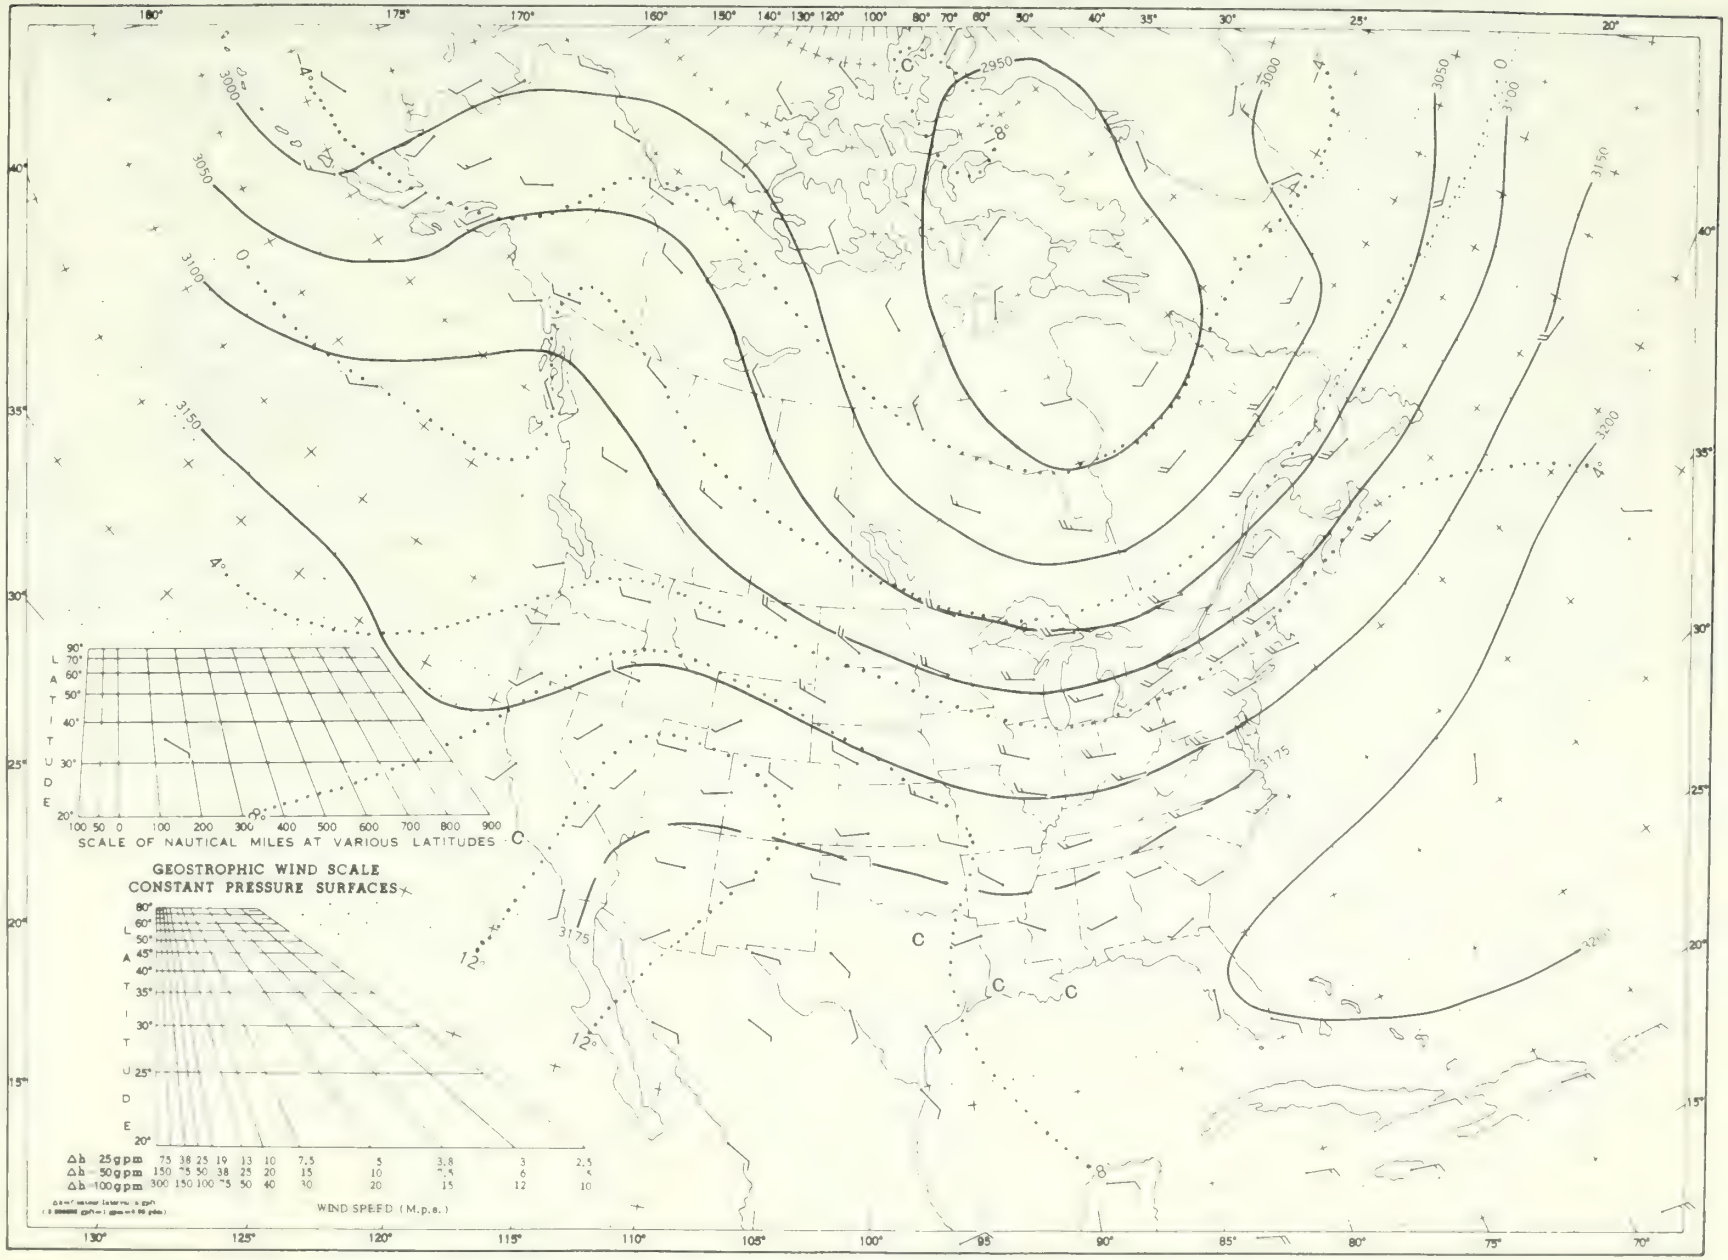
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, July 1971.



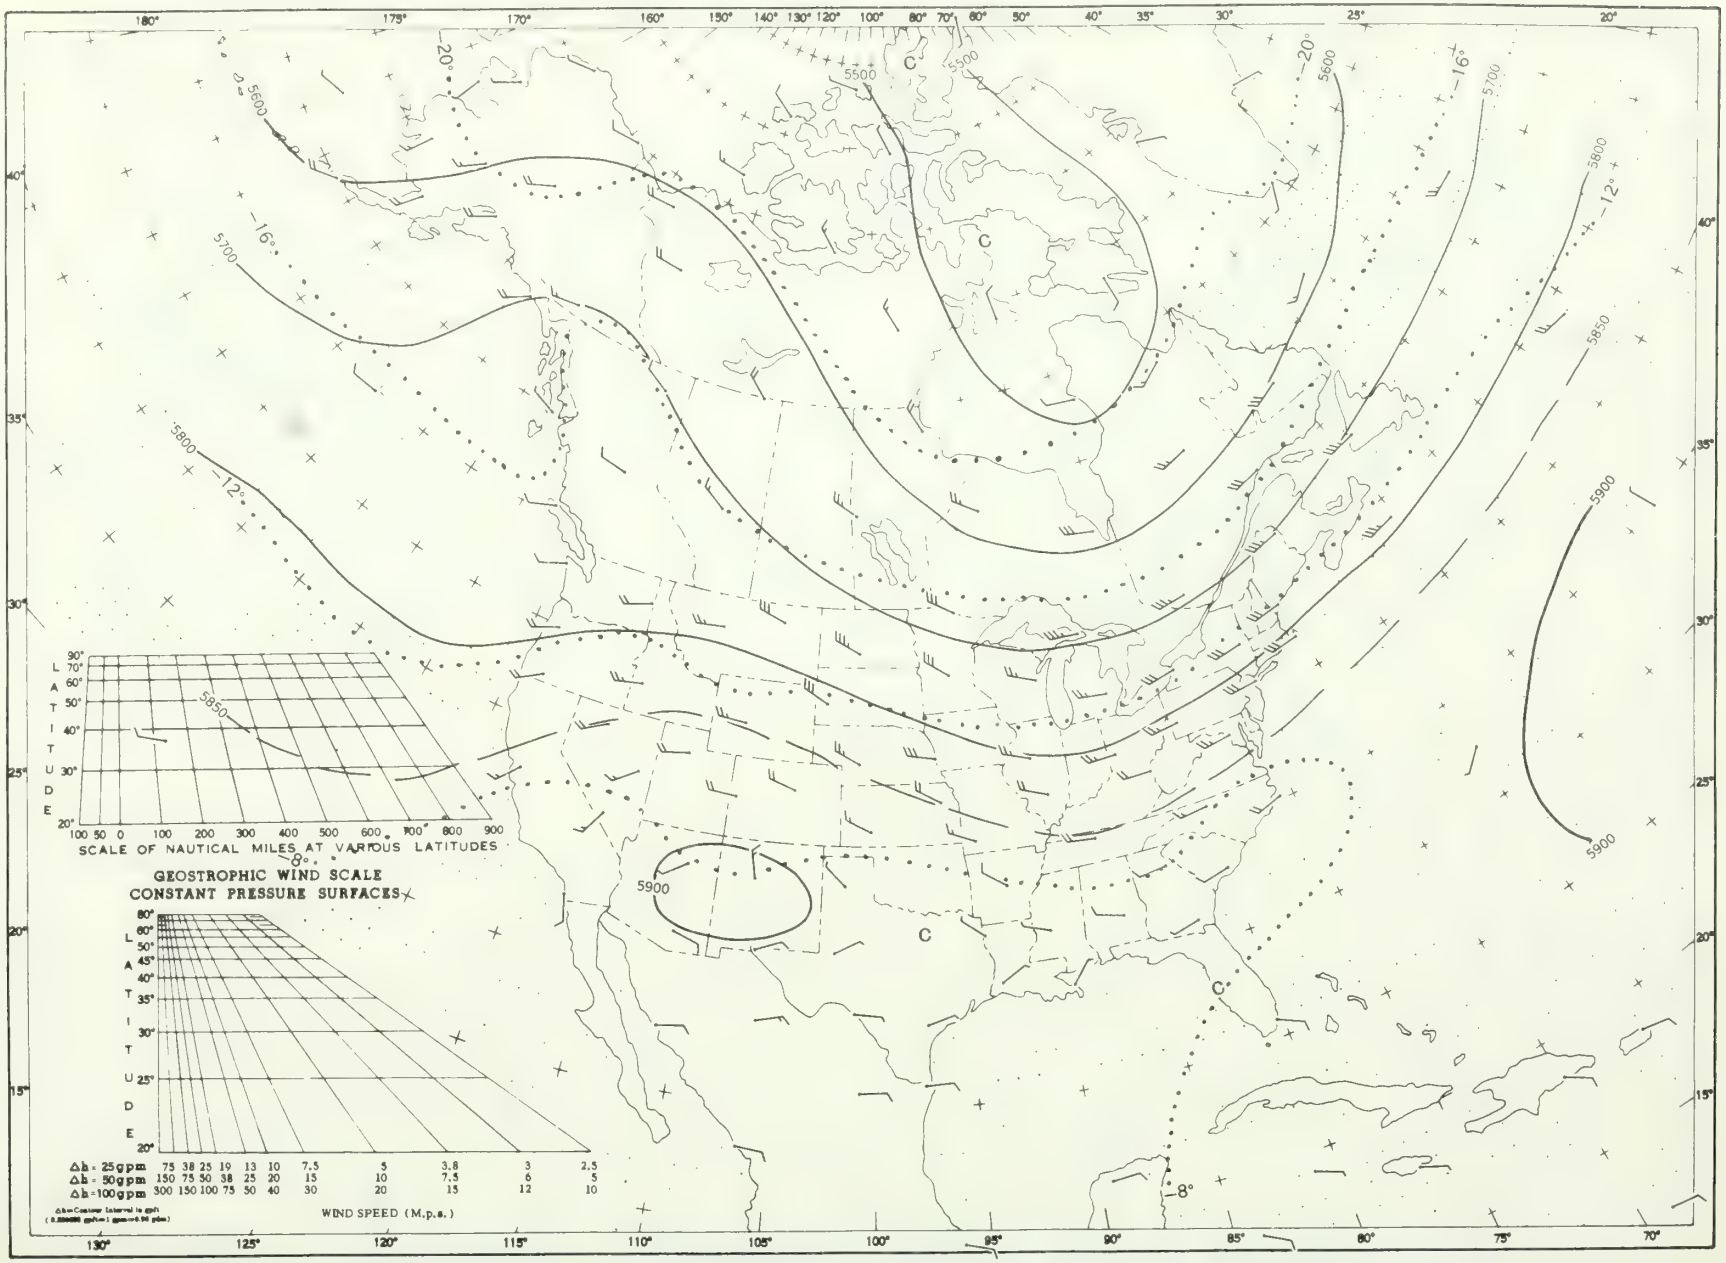
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, July 1971. Inset Departure of Average Pressure (mb) from Normal, July 1971.



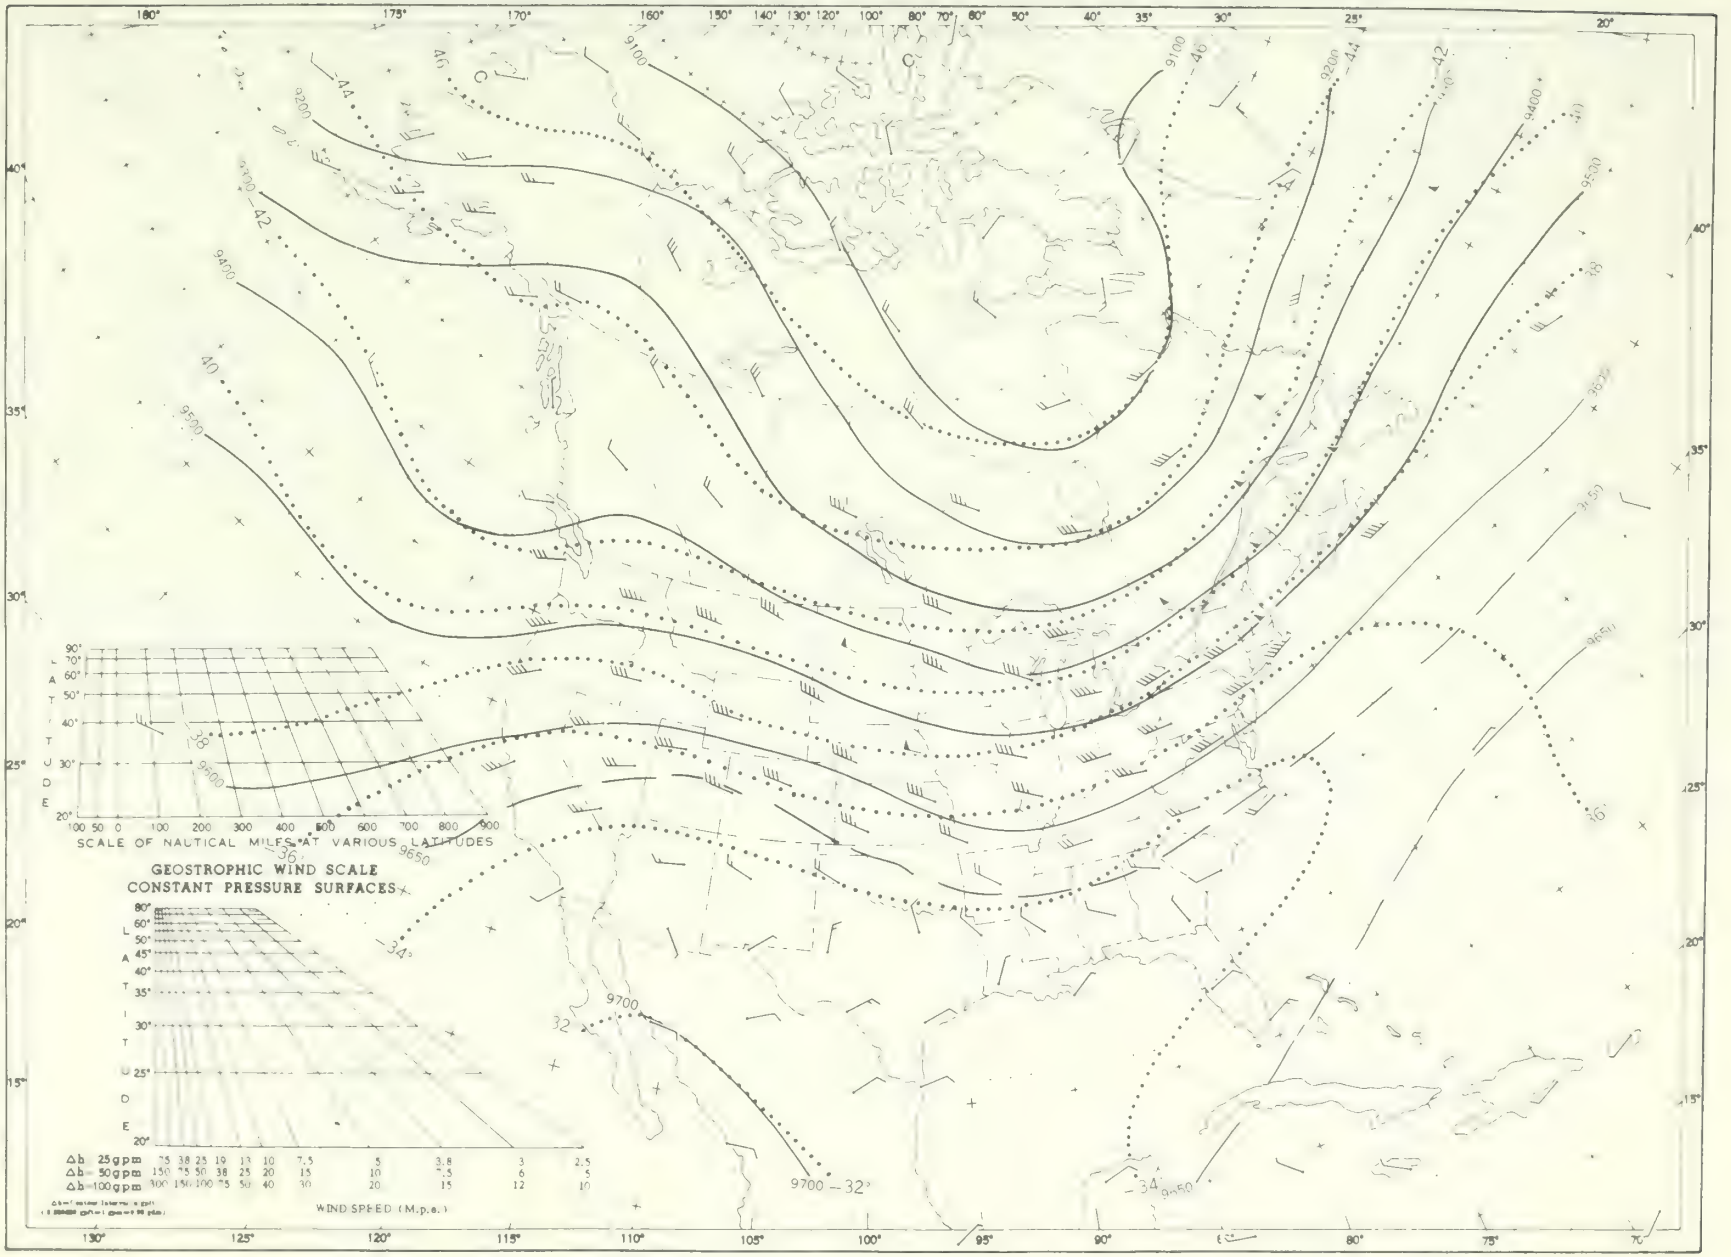
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed/average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 850-mb Surface, 1200 G.m.t., July 1971. Average Height and Temperature, and Resultant Winds



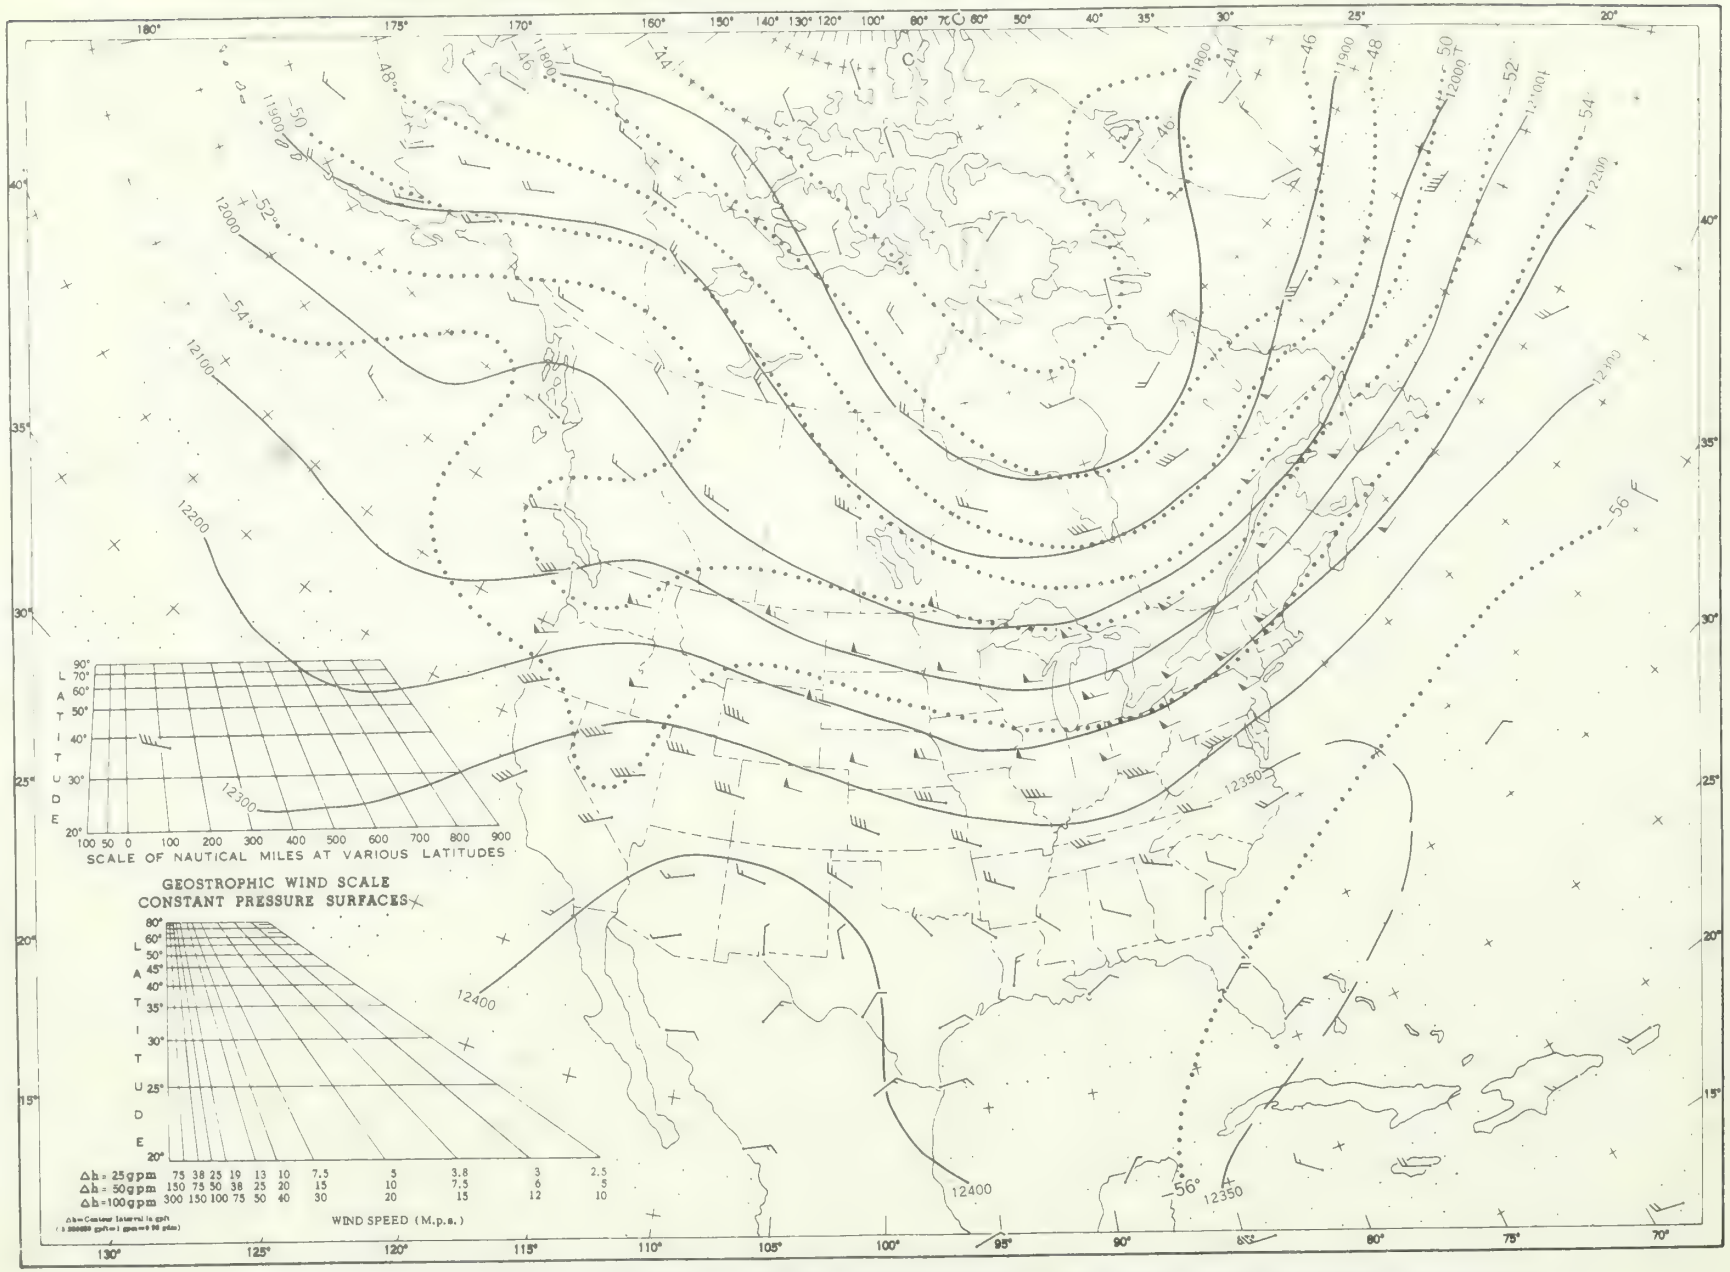
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII 700-mb Surface, 1200 G.m.t., July 1971. Average Height and Temperature and Resultant Winds



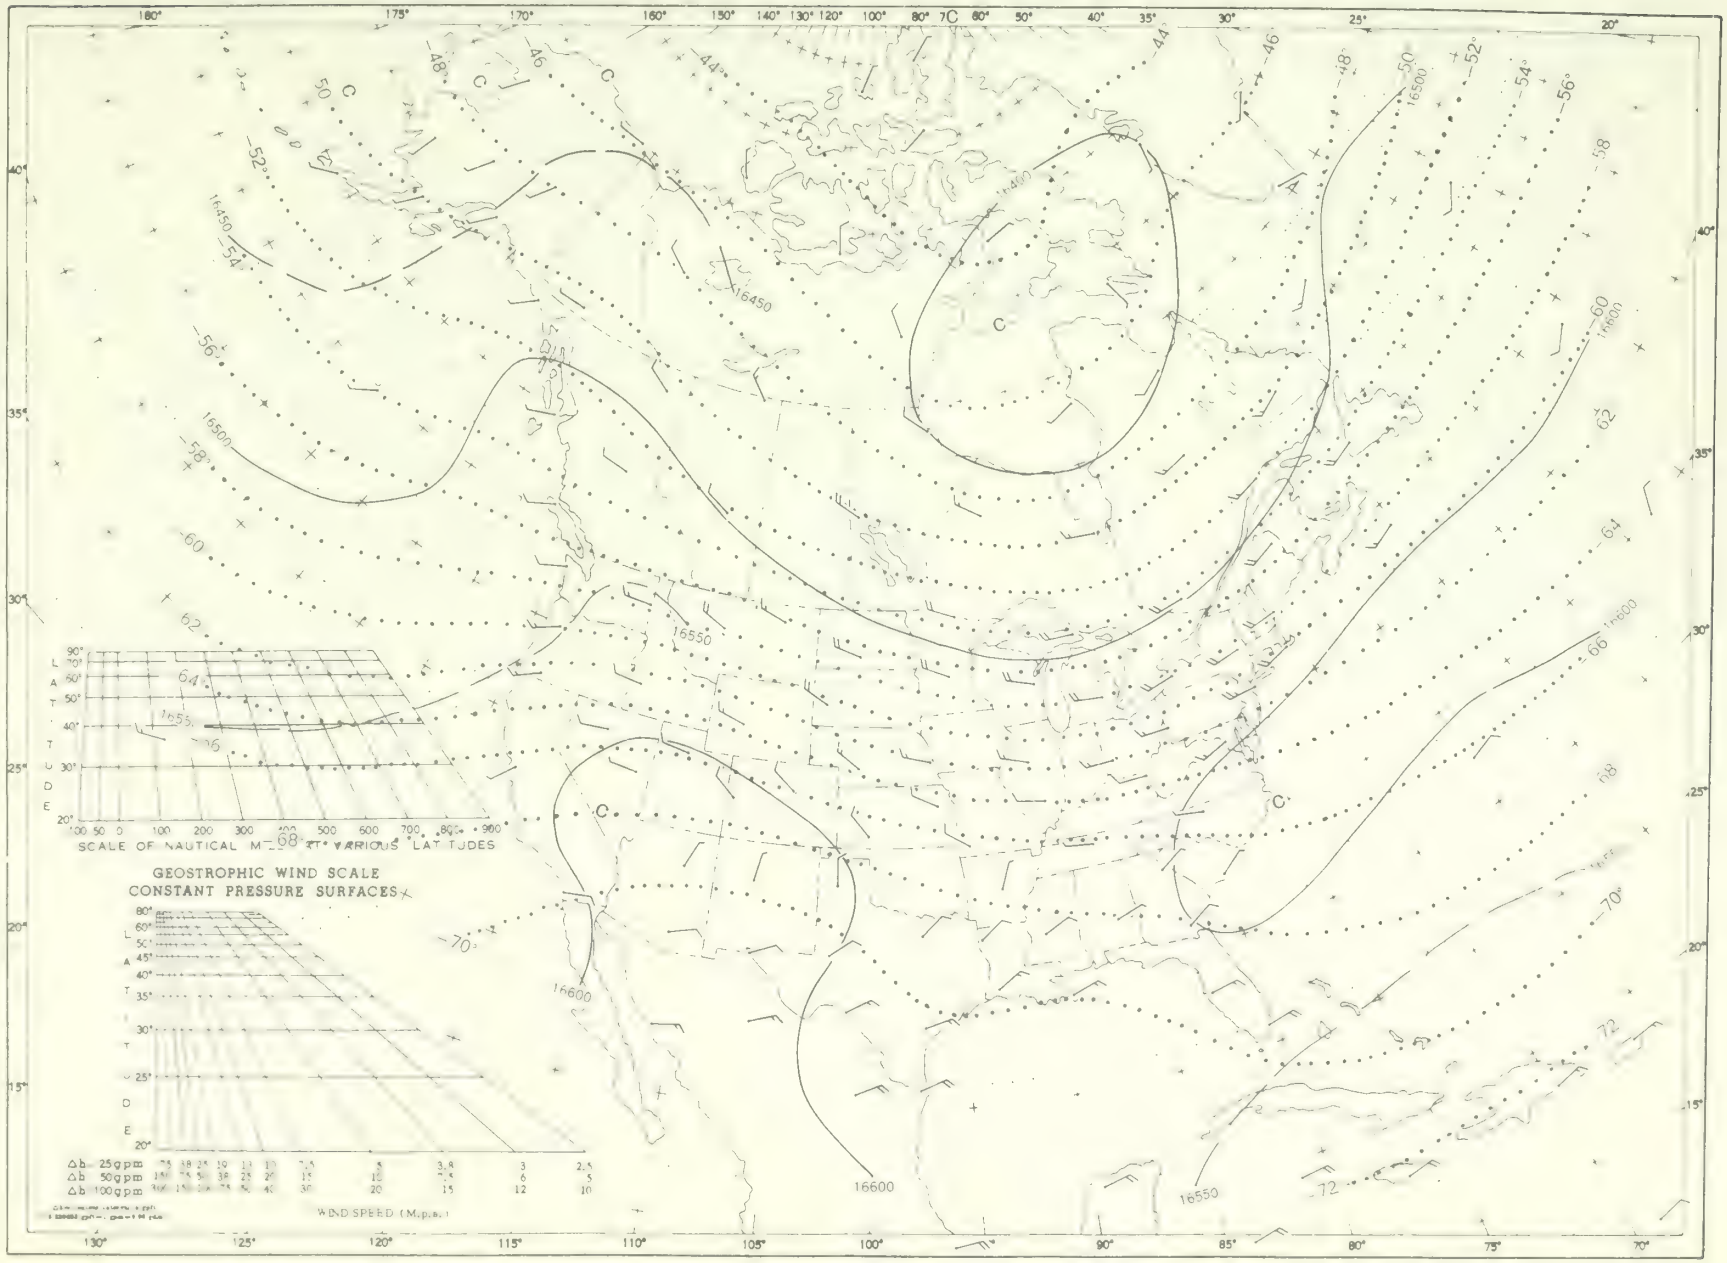
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 G.m.t., July 1971. Average Height and Temperature, and Resultant Winds



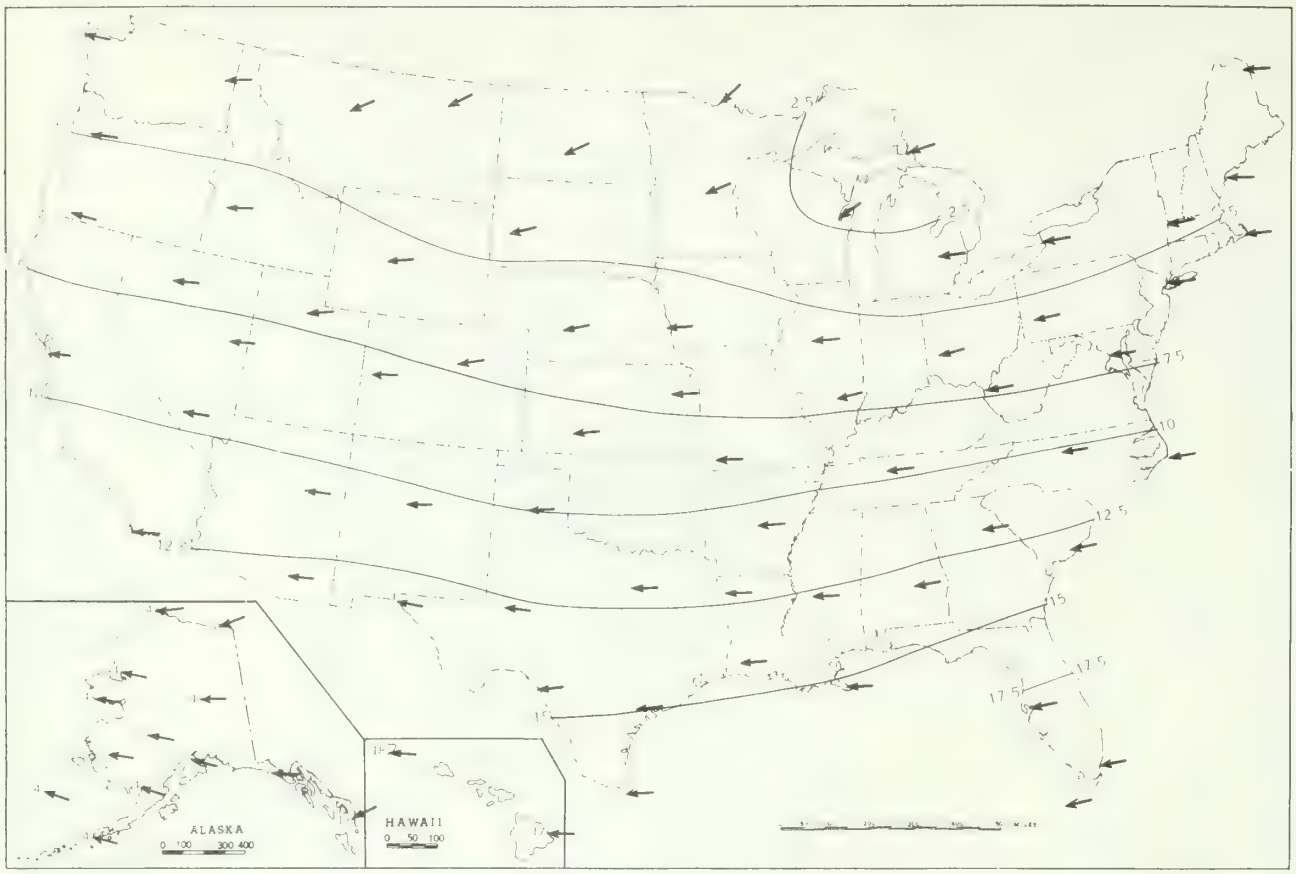
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV 300-mb Surface, 1200 G.m.t., July 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb Surface, 1200 G.m.t., July 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

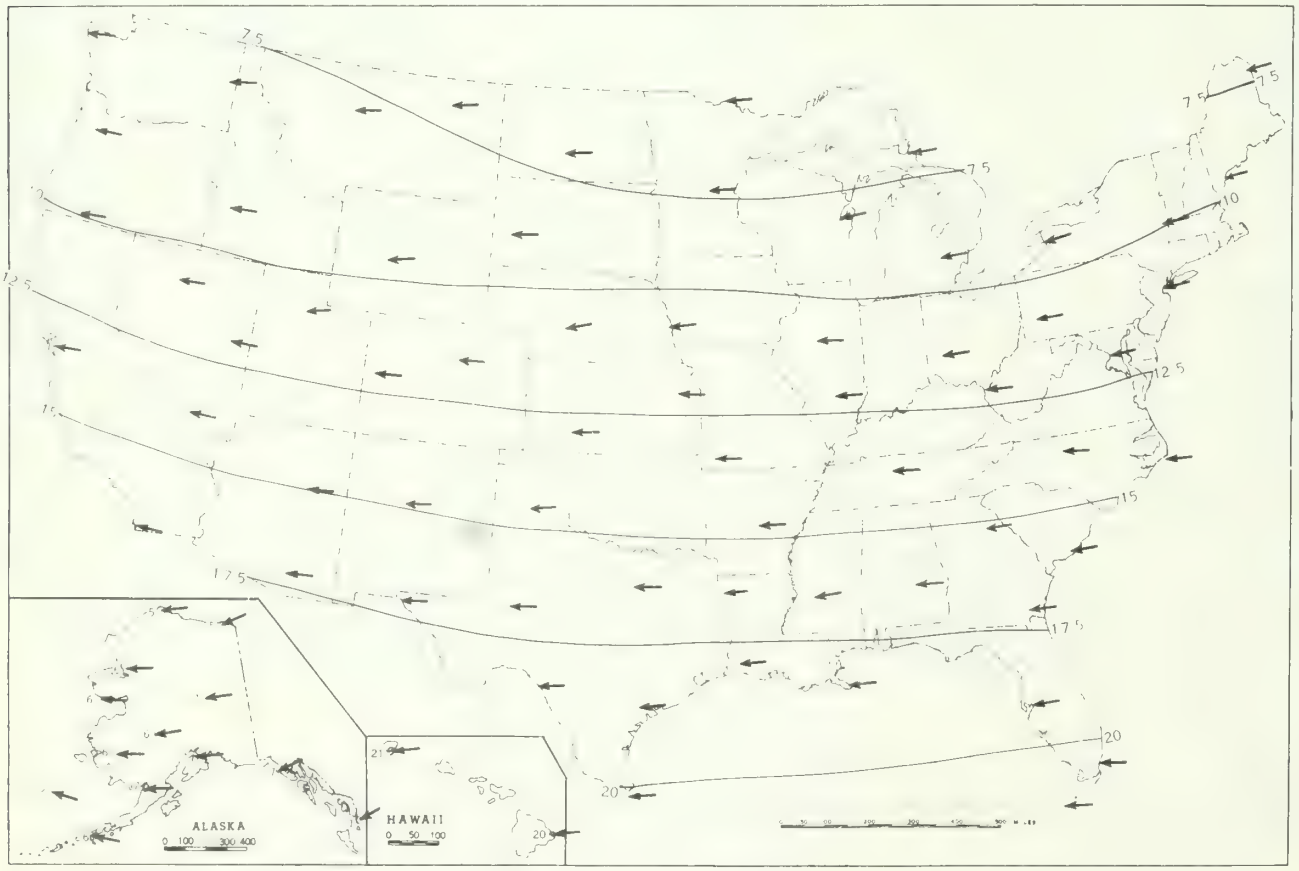


Chart XVI 100-mb Surface, 1200 G.m.t., July 1971. Average Height and Temperature, and Resultant Winds

Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

B. 30-mb. Surface, 1200 G.m.t., July 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

AUGUST 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. August 1971 was a month of sharp weather contrasts. The temperature at some localities in the Far Northwest reached 90° frequently while some southern areas experienced the coolest August of record.
2. Some areas saw the driest August in 100 years. Much of central Texas received more than four times the normal rainfall.

TEMPERATURE--A large HIGH moved slowly from Canada to the Upper Mississippi River Valley bringing autumn chill to the North Central and Northeast in the first few days of August. Maximums in the seventies were common from the Red River of the North to New England. By August 5, the cool air had spread southward to Kentucky and Virginia and the temperatures over much of the Northeast resembled those expected in mid-September. Summer heat continued over the West with maximums reaching 100° to 110° in the Southwestern Deserts almost every day and reaching 100° to 105° on several consecutive days at Havre, Mont. Death Valley, Calif., warmed to 124° on August 10. Clear skies and mild temperatures prevailed over most of the Nation at midmonth. The northern Great Plains, however, were somewhat warmer than normal. Among the higher temperatures in the northern Great Plains by midmonth were 105° on the 5th and 6th at Havre, Mont., and 99° at Mobridge, S. Dak., on the 23d. Maximums ranged from the seventies in the Great Lakes Region and New England to the eighties and low nineties in the Deep South. The last week of August brought continued warm weather over the West while a large HIGH over the Great Lakes spread early autumn temperatures over the Northeast. Temperatures over the Southeast continued within a few degrees of normal. Freezing temperatures occurred in the high Rockies, 26° at Big Piney, Wyo., on the 24th, and at some northern locations, 32° at Pellston, Mich., also on the 24th.

Temperatures averaged above normal northwest of a line from Arizona to the Dakotas and below normal over most of the area southeast of that line. A few spots averaged 3° or more below normal. At Nashville, Tenn., the temperature reached 90° on only a few days. The 5-year average is 17 days in August with 90° or higher. At Winston-Salem, N. C., the temperature failed to reach 90°, the first such occurrence in their entire weather record.

PRECIPITATION--Generous showers and thunderstorms occurred from southern New England to the Lower Rio Grande Valley along the front marking the leading edge of a large HIGH which pushed from south-central Canada into the United States. Especially heavy showers fell in southern Texas. Camp Bullis, near San Antonio, received 13.10 inches of rain in the 48-hour period ending on the morning of August 3. Much of the Northeast received moderate to heavy rain in the first few days of August from the slow-moving system. From 6.00 to 12.50 inches of rain in eastern and northeastern Baltimore, Md., caused 16 deaths and millions of dollars' property damage.

Some severe weather, thunderstorms accompanied by hurricane-force winds and hail, occurred over the northern Great Plains early in the second week of August. Generous showers covered much of the Corn Belt from northern Missouri to Lower Michigan. On the 11th, showers fell from Texas to New England. The heaviest showers fell in Texas where up to 8.00 inches fell in the Hondo and Seco Creek Watersheds west of San Antonio and up to 5.25 inches fell in the Upper Guadalupe Basin northwest of San Antonio. Widespread flooding occurred on August 12 in parts of Alaska. Floods and washouts closed roads and highways between Fairbanks and Anchorage and isolated Palmer, Alaska.

Heavy rains fell shortly after mid-August in connection with a tropical depression that moved along the Carolina coast. Sullivans Island, S. C., received over 8.00 inches in 24 hours ending on the morning of the 17th and Pee Dee, S. C., received 9.11 inches in 48 hours ending at that same time. Tropical Storm Doria moved northward along the Atlantic Coast in the last week of August, soaking most areas with 4.00 to more than 6.00 inches of rain. Winds associated with Tropical Storm Doria were generally about 60 m.p.h., but gusts occasionally reached hurricane speed. Flooding and wind damage were widespread. Doria lost most of her energy as she crossed New England August 28 and pleasant weather returned to most of the Northeast by the 29th.

Monthly rainfall totals were especially small over North Dakota and much of the western Corn Belt. Only .03 inch fell at Bismarck, N. Dak., during the entire month. At Moline, Ill., August 1971 was the driest August in a hundred years. At numerous locations, it was the driest August in several decades. In contrast, rain in much of central Texas ranged from 200 percent to more than 600 percent of normal.

For further details regarding Hurricane Doria, see this month's issue of Storm Data.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day-data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
· And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

TROPICAL STORM DORIA FLOODS—NEW JERSEY

AUGUST 1971

Elmer R. Nelson, Office of Hydrology

Tropical Storm Doria moved up Maryland's southern Eastern Shore through Delaware into New Jersey during the evening of Aug. 27. It moved into New Jersey, west of Cape May during the late evening of Aug. 27 and the early morning of Aug. 28. The track over land prevented the storm from developing into a hurricane. Winds associated with tropical storm Doria were generally about 60 m.p.h. but gusts occasionally approached hurricane speed. Philadelphia, Pa., recorded 74 m.p.h. gusts and Bridgeport, Conn., 75 m.p.h.

At 2 a.m. on Aug. 28, a flash flood warning bulletin was released by the National Weather Service as it was apparent from radar and rainfall reports that from 2 to 4 inches of rain would accompany the northward movement of Doria through New Jersey. The bulletin emphasized the danger of flash flooding and that forecasts for the main rivers would be revised.

The antecedent precipitation index in New Jersey was high as heavy rains had occurred during the previous 24 hours. The rainfall from the northward moving warm front during the night of Aug. 26-27 was especially heavy in New Jersey and a portion of southeastern Pennsylvania. The 12 to 18-hour rainfall totalled from 4 to 9 inches over most of New Jersey extending from northern Delaware, southeastern Pennsylvania through the Trenton area into northeastern New Jersey. See figure 1 for the amount and distribution of antecedent precipitation. The weather maps for Aug. 26, and Aug. 27 reveal the slow northward moving warm front that caused the heavy rains. The rain in New Jersey ended in the late afternoon and early evening of Aug. 27. This antecedent rain was sufficient to raise the water level of many streams up to near or slightly over bankfull.

The Rahway-Elizabeth, N. J., areas were especially hard hit by both tidal and falsh flooding.

Extremely heavy rainfall accompanied tropical storm Doria as it moved northeastward across New Jersey. Two to 5 inches of rain was reported in less than 4 hours during the late evening of Aug. 27 and during the early morning of Aug. 28. See figure 2 for the amount and distribution of rainfall accompanying tropical storm Doria. The Weather maps for Aug. 28 and Aug. 29 show the northeastern movement of tropical storm Doria.

The total storm rainfall in New Jersey, covering the two precipitation periods ranged from 7 to around 11-1/2 inches through the interior portion of the state. See figure 3.

The rainfall amounts in New England ranged from about 6 inches in southwestern Connecticut to 3 to 4 inches in central New England and 1 to 2 inches in northern and eastern New England.

This excessive rainfall resulted in rapid flooding in many areas of New Jersey. Flash floods were widespread during the early morning hours of Aug. 28. The water level of Bound Brook Creek at Bound Brook, N. J. was reported to have risen 10 feet in 30 to 45 minutes. Major flooding developed later on during the day on the lower Passaic, Saddle, Millstone, Raritan, Rancocas Rivers and Assunpink Creek. These rivers reached crests near or above record levels. See table 1, Comparative Crest State Data of Major Floods and figure 4 for location of rivers and stations.

Only minor small stream overflows were reported from scattered areas in southern and central New England. All major rivers were well within their banks. Considerable street and road flooding resulted from clogged or insufficient capacity of sewers and culverts.

This flood was the most damaging throughout the Raritan River basin and the Assunpink Creek in central New Jersey. The communities hardest hit were Bound Brook, Raritan, Green Brook, Lodi, Manville and Elizabeth, N. J. Power failures, road washouts, homes flooded and evacuations were widespread throughout Bucks County, Pa., and New Jersey except the northwest hills and the coastal sections of New Jersey.

Tidal flooding from tropical storm Doria was not serious. However, considerable pier, boat and beach damage was caused by wave actions.

A federal-state survey team estimated the damage in New Jersey at $138.5 million. Of this total, damage to public property was estimated at $53.5 million and damage to residential, industrial and commercial property at $85 million. In Bucks County, Pa., flood damages were estimated at $150,000. Three deaths by drowning were attributed to Tropical Storm Doria.

The warnings, bulletins and statements issued by the National Weather Service were timely and effective. User response was excellent. Specific precautions and actions were taken as a result of the NWS releases, bulletins and forecasts.

ACKNOWLEDGMENTS

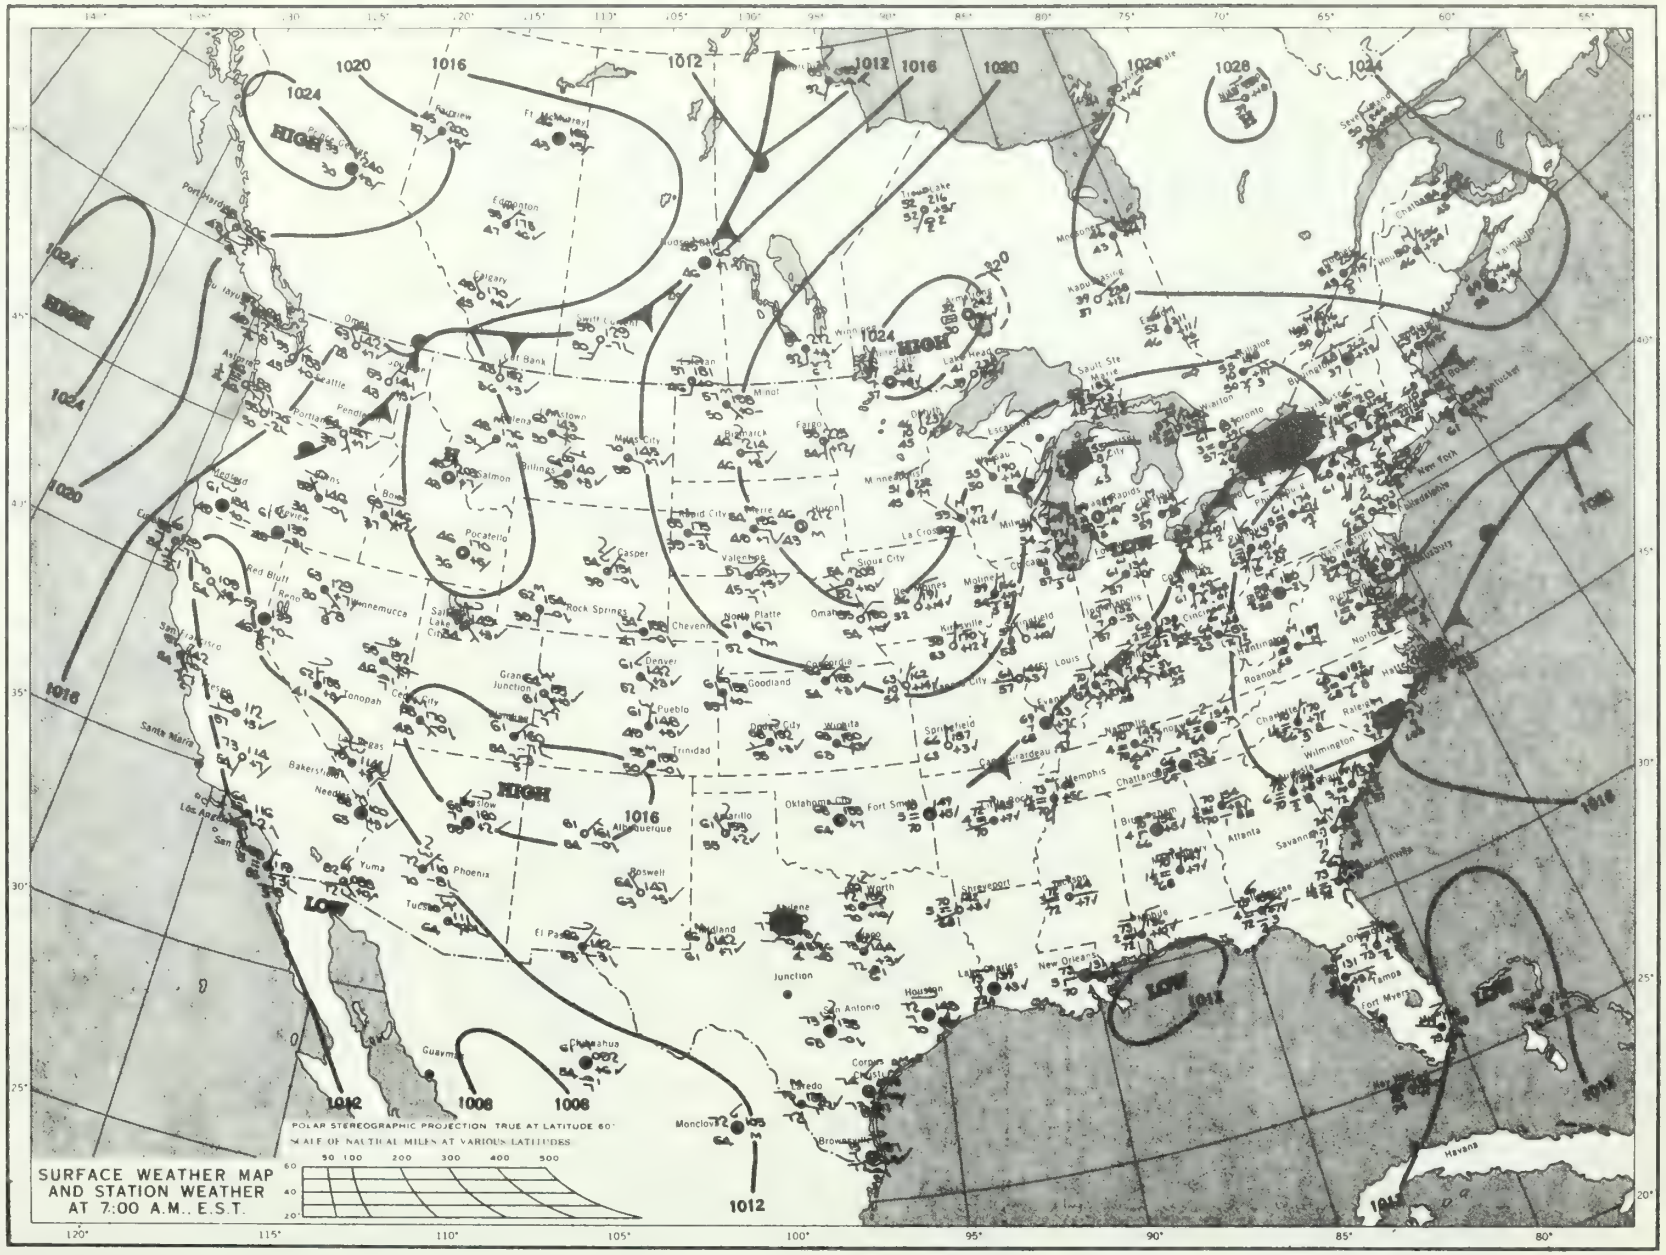
Acknowledgments are due the following:

1. Joseph A. Strahl, Chief, Operations Branch, Hydrologic Services Division for general guidance in preparation of report.

2. Herbert Groper, Meteorologist in Charge, National Weather Service, Trenton, N. J., and Donald V. Dunlap, Climatologist for New Jersey, for excellent report on flood and furnishing essential data.

3. Environmental Data Service for weather maps.

4. Federal-State Survey team for estimate of flood damage.



5. Elizabeth Journal, Elizabeth, New Jersey, for photograph used in report.

TROPICAL STORM DORIA — AUGUST 20 - 29, 1971

Tropical storm Doria was the third tropical cyclone this season to skirt the U.S. Atlantic coast. She was the first to cross it. Doria brought much-needed rain, yet the rain was responsible for flooding, and flooding was responsible for five of the seven storm-related deaths. In New England, Doria's storm surge fortunately occurred at low tide. Yet, sightseers were able to get close to the shore and one person drowned while saving two others who had been pulled in by the surf. Damage estimates are $147.35 million. Most damage was the result of flooding. Six people were killed: three in New Jersey, one in Massachusetts, one in Pennsylvania, and one in Virginia.

Doria was spawned by an African disturbance which had moved across the Atlantic. Interest in the system was spurred by satellite pictures early on August 20. These pictures showed an organized cloud pattern about 1,000 miles east of the Windward Islands. Reconnaissance aircraft reached the newly formed tropical depression later in the day. There was little change in Doria's second stage of development as she moved west-northwestward through the Leeward Islands on the 23d and into the Bahama Islands on the 25th. The storm became better organized and generated 35 to 40 m.p.h. squalls northeast of its center. On the afternoon of the 26th, reconnaissance aircraft found a definite pressure center of 1008 millibars about 100 miles north of the Bahamas. The depression was named Doria and few hours later became a tropical storm. She plodded northward and deepened 20 millibars in 24 hours.

Early on the afternoon of the 27th, Doria crossed the North Carolina coast, west of Morehead City. Just prior to landfall, her central pressure reached its lowest point - 29.20 inches (989 mb.) Doria pounded eastern North Carolina with gales and driving rain as she moved across the State and into southeastern Virginia that evening. The Outer Banks and the shores of Pamlico and Albemarle Sounds were pelted by 4- to 5-inch rains, lashed by 60 m.p.h. wind gusts, and inundated by tides 1 foot to 2 feet above normal. At Atlantic Beach, close to Doria's point of landfall, winds reached 69 m.p.h. in gusts, tides were 3 to 4 feet above normal, and pressure dropped to 29.38 inches. Heaviest rains fell ahead of the storm, and the 4-inch totals were confined to eastern sections of the State. Damage throughout North Carolina was minor, and estimates of property and crop damage were about $150,000. No storm related deaths were reported.

The day before Doria reached North Carolina, a stationary frontal trough hung over the east coast, bringing rains from North Carolina to New England. The combination of this trough and Doria produced the high rainfall totals that occurred during the 2-day period. The storm rainfall amounts resulted from this combination of factors.

Doria accelerated and moved up the Virginia-Maryland-Delaware shore during the night of the 27th. Norfolk sustained 52 m.p.h. winds in the early evening, and tides were 3.6 feet above normal at Portsmouth Navy Yard. Doria spawned a tornado which touched down near Norfolk Regional Airport causing some $250,000 damage. The tropical storm itself caused some $125,000 damage in southeastern Virginia. Damage was mainly from flooding and fallen limbs. One person drowned in northern Virginia. Along Maryland's Eastern Shore and in Delaware, Doria was accompanied by 50 m.p.h. gusts, tides 2 to 4 feet above normal, and rains of 5 to 8 inches. Chesapeake Bay tides were 1 to 2 feet above normal. Annapolis, Md., recorded 8.76 inches of rain, Cambridge, Md., 7.40 inches, and Talleyville, Del., 7.96 inches. Despite the flooding damage and minor wind damage, rains benefited late-maturing crops, fall seeding of cover crops, and pastures.

In the early morning hours of the 28th, Doria made her way up the Jersey shore toward New York City. It was in New Jersey that she wrought the most damage. Excessive rainfall had occurred over most of New Jersey and southeastern Pennsylvania during the 24 hours preceding Doria. Although the rainfall that could be directly attributed to Doria was less than that from the front, the combined fall in a short period of time produced devastating floods in central and northeastern communities of New Jersey and minor flooding in the southeastern counties of Pennsylvania. In the Pennsylvania counties of Chester, Delaware, Montgomery, Philadelphia, and Bucks, flash floods closed streets and caused power failures. Rainfall totalled over 6 inches in parts of the area, with a 6.57-inch fall in Philadelphia and an unofficial 7.5 inches reported at Kennett Square near the Delaware border. The strongest reported wind was a 73 m.p.h. gust in Philadelphia. One person was killed by a falling limb in Chester County.

The hardest hit New Jersey communities were Bound Brook, Manville, and Elizabeth. Trenton set a 24-hour record with 7.55 inches of rain and had an 8.09-inch total. The old Trenton record was 5.42 inches during a 24-hour period in October 1903. New 24-hour marks were also set at New Brunswick and Newark. Newark was deluged with 8.01 inches of rain. Streets and highways became flooded in many areas, and mudslides blocked some roads in Middlesex County. New York to Philadelphia railway service was interrupted for some 29 hours when water flooded the Trenton station. The American Cyanamid Company at Bridgewater suffered severe flooding. Total damage in New Jersey was estimated at $138.5 million. Of this amount, $53.5 million was done to bridges, and water and sewer systems, and $85 million to other private and industrial property. Minor damage and beach erosion resulted from the 25 to 45 m.p.h. winds and tides of 2-4 feet above normal along the coast. Three people drowned in New Jersey.

Come Saturday morning, early-rising New Yorkers awoke to the sound of 20 to 30 m.p.h. winds and a second straight day of driving rain. Stronger winds of 30 to 40 m.p.h. with gusts to near 50 m.p.h. had occurred earlier in the morning. Before the storm was finished, 5.96 inches of rain fell at Central Park, 3.69 inches at Kennedy Airport, and 5.49 inches at LaGuardia Airport. At LaGuardia, 2.29 inches fell in 1 hour on the afternoon of the 27th. The early morning tide at the Battery was 4.7 feet above normal. Out on Long Island, at Bridgehampton, winds gusted to 60 m.p.h. but rain totalled only 0.41 inches.

Heaviest precipitation occurred from New York City northward up the Hudson River Valley to the Poughkeepsie-Kingston area. Amounts ranged from 6 to 8 inches during the 27th-28th. Staten Island recorded 7.86 inches, and Glenham in southwestern Dutchess County reported 7.81 inches. Rain totalling 4 to 5 inches fell as far north as Lake George, and totals of 2.5 to 3.5 inches were reported as far west as Sullivan, Delaware, and Otsego Counties, as well as in the eastern Mohawk Valley and northward through Essex County. Precipitation decreased eastward across Long Island from the totals of 6 to 8 inches around New York to 2.5 to 3.5 inches in Nassau and northwestern Suffolk County and to less than 1 inch on the eastern end of the Island.

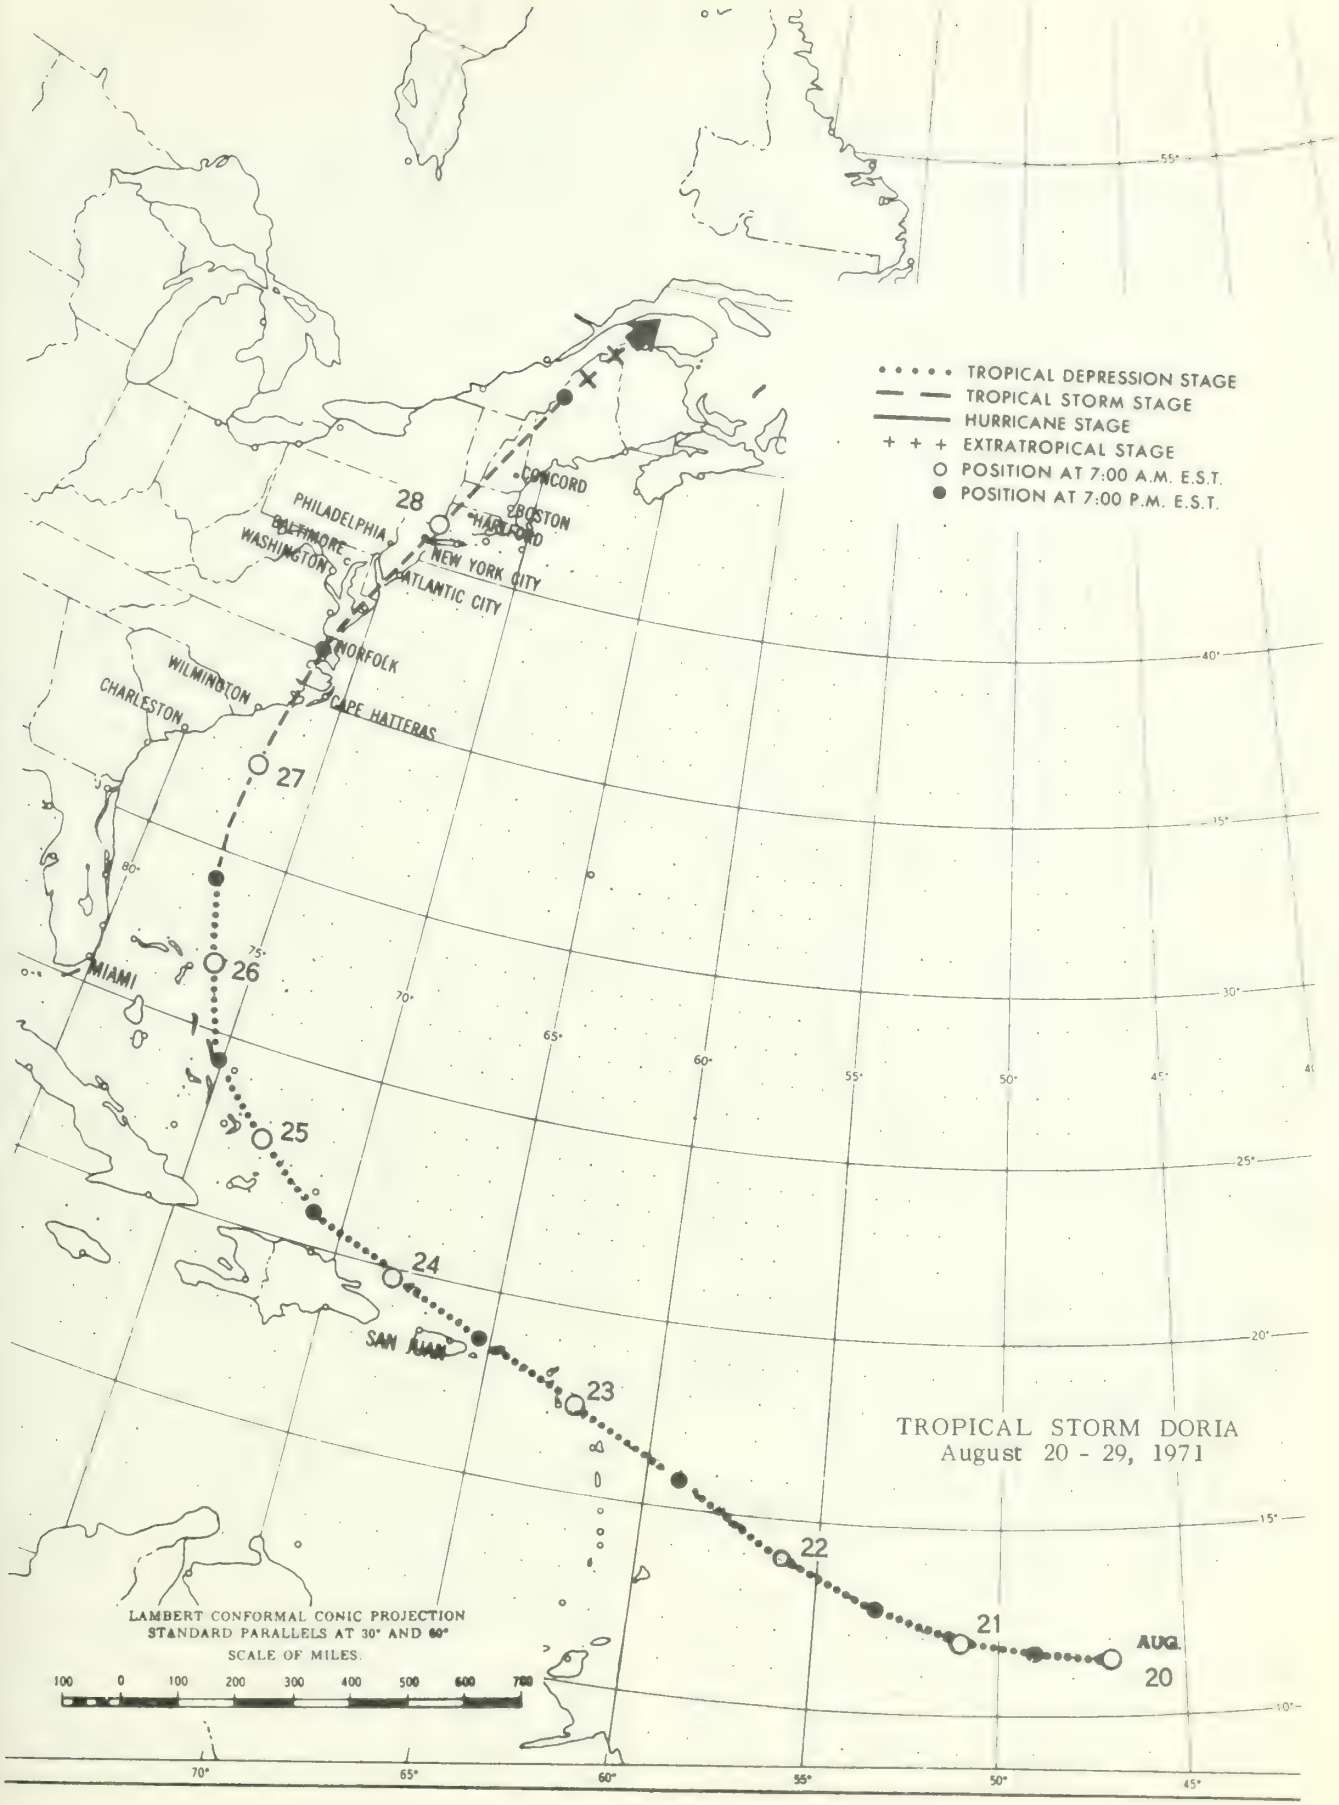
Streets, highways, and subways were flooded in New York City, and all surface transportation was greatly hampered. Similar flooding occurred on western Long

Island and over much of the Hudson River Valley with overflowing of small streams and creeks. Wind damage was light with downed limbs and powerlines representing the primary source of trouble. Some 25,000 homes were without power on Long Island. Agricultural losses were light: some fruit was dislodged from trees and some corn blown over. Total damage in New York was estimated at $4.32 million.

Doria began to weaken as she headed inland over western Connecticut and western Massachusetts on Saturday morning. However, her forward speed increased to 35 to 40 m.p.h. Strongest winds were east of her center. Bridgeport experienced a 75 m.p.h. gust. At Boston, gusts were reported at 56 m.p.h. and on top of Blue Hill at Milton, Mass., an 87 m.p.h. gust was recorded during the morning of the 28th. Winds gusted to 52 m.p.h. as far north as Concord, N.H.

While the storm surge produced tides up to 5 feet above normal, tides at the time were near their low and coastal flooding was minimal. However, high surf did batter some homes and swamp some small boats. Sightseers were out in force to admire the pounding surf. At Marblehead, Mass., a young man was drowned after rescuing two others who had been caught by the high surf.

Rain in New England was heaviest mainly west of Doria's center. The combination of the frontal system and the tropical storm produced 5- to 6-inch rains from Pittsfield, Mass., to north of Brattleboro, Vt., and 6-inch totals in southwestern Connecticut. Northwestern Connecticut, western Massachusetts, and Vermont had 2 to 4 inches of rain. In eastern Connecticut, northwestern Rhode Island, central Massachusetts, New Hampshire, and central and western Maine, 1- to 2-inch totals were common; some sections of New Hampshire had 2 to 3 inches. Elsewhere, totals were less than 1 inch.



In Connecticut and throughout most of New England, east of the storm's center, the ground was littered with leaves, branches, and often whole trees. Utility lines were knocked down in some areas. Some 150,000 homes were without electricity in Connecticut. Autos and buildings were damaged by fallen limbs. Structural damage to a Connecticut high school was estimated at $250,000. Crop damage was spotty. Some apple orchards lost up to 15 percent of their crop. Some peach orchards were hard hit, and corn was blown down in some areas. A 270-foot television tower was blown over in Brunswick, Maine. Vermont got little wind, but rain washed out several bridges. Total preliminary damage estimates for Connecticut and New England run from $4 to $5 million.

During the afternoon of the 28th, Doria started to turn extratropical as she tore across western Maine. That evening she raced into Canada and across the St. Lawrence River.

° Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
AUGUST 1971

Elmer R. Nelson, Office of Hydrology

The most damaging floods during August occurred in New Jersey from the heavy rains accompanying Tropical Storm, Doria. The total damages were estimated at $138.5 million and the total number of deaths were placed at three. See the special article on "Tropical Storm Doria Floods - New Jersey," following the general summary of river and flood conditions.

Severe flash flooding accounted for 16 deaths and approximately $1 million in property damages in Baltimore City and Baltimore and Harford Counties in Maryland on August 1-2.

Major flooding occurred on the Matanuska and Susitna Rivers in Alaska on Aug. 6-9. The total damages were estimated at $5.8 million. This was the second most damaging flood in Alaska's history.

ATLANTIC SLOPE DRAINAGE

Heavy thundershowers during the afternoon of Aug. 1 caused flash flooding in the Saucon Creek Basin south of Allentown, Pa. Floodwaters caused extensive damage estimated at almost $300,000. Of this total, around $200,000 damage was reported at the site of the St. Francis De Sales College in Center Valley. The library located in the basement of De Sales Hall was severely damaged. One death was reported at Saucon Park when a little girl fell into the creek. Some 60 people who ignored a warning to leave the rain threatened area had to be evacuated from a picnic grove, south of Hellertown.

Flash floods occurred on small streams in the Washington, D. C., metropolitan area on Aug. 3 and Aug. 27. During the latter storm, two deaths were reported. One drowning occurred in Alexandria, Va., when a small girl fell into a drainage ditch and was swept through an underground pipe. Her body was found in a creek more than a quarter mile away. Property damage along Four Mile Run in Arlandria, Va., was estimated at $50,000. The second drowning occurred in the Kentland section of Prince George County when a youth was swept into high water near Beaver Dam Creek. The youth was carried away when the narrow creek overflowed its banks and swelled to a width of 15 feet. In the Temple Hills' area of Prince George County, children swam in residential streets covered with water up to 4 feet deep. Flooding on the John Hanson highway resulted in all traffic being rerouted to the Baltimore-Washington Parkway. A Greyhound bus, bound from Richmond to New York, overturned after a braking skid on the wet pavement on the parkway. This resulted in minor injuries to at least a dozen passengers. Dormitory basements on the American University Campus in northwest Washington were flooded. Rush hour traffic throughout the Washington area was delayed for hours as homebound motorists encountered bumper-high water on many major roadways. In the District of Columbia, the Minnesota Avenue viaduct at Dean Avenue and the intersection of Benning Road and East Capitol Street were under more than 2 feet of water. The flash flooding was due to heavy rains that began shortly after midnight on the 26th-27th. The heavy rains continued throughout the 27th. By late on the 27th, 4 inches of rain had fallen at Suitland, Md.

During the evening of Aug. 1 and the early morning of Aug. 2, scattered thunderstorms caused severe flash flooding in Baltimore, Md., Baltimore County and Harford County in Maryland. Major east coast highways were closed by the high water for more than 6 hours. Hundreds of residents were left homeless and some 20,000 homes were without electricity. Property damage, both public and private, was estimated at approximately $1 million. Sixteen deaths resulted from the floods. Much of the damage and many of the casualties occurred in Baltimore City and Baltimore County in the vicinity of White Marsh, Md., and along State Route 7, U. S. 40, and Interstate 95 along Gunpowder River and its tributaries. Supplemental precipitation surveys indicated that up to 12.5 inches of rain fell between 6:30 p.m., Aug. 1 to 2:30 a.m., Aug. 2, near White Marsh, Md. Several other locations indicate more than 11 inches of rain during that storm. In general, the precipitation exceeded 5 inches in an 8-hour period in southeastern Baltimore County and in the city of Baltimore. Preliminary reports show that three new crest records were set during the flash flood. They were on White Marsh Run at White Marsh, Md., Stemmers Run at Rossville, Md., and Brien Run at Stemmers, Md., all in the vicinity of the 12.5-inch center. Estimated time of crest at all three sites was around 11 p.m., Aug. 1.

Significant precipitation occurred in eastern North Carolina in advance of Tropical Storm Doria during the evening of the 26th, continuing through the 28th. Rainfall from this storm averaged from 1 to 3 inches, with some isolated areas in eastern North Carolina and south-central Virginia recording a total of more than 5 inches. Some flooding occurred in the low-lying areas where the heavier showers fell, but all rivers remained within their banks. Some damage occurred in the northeastern Cape Fear Basin.

A tropical depression formed in the northeastern Gulf of Mexico on the 16th and moved northward through eastern Georgia and the Carolinas on the 17th and 18th. Rainfall totalled over 9 inches within 72 hours at Peedee, S. C. Three to 4 inches occurred locally within 24 hours over the Edisto, Black, Waccamaw, and Little Pee Dee River basins. Flooding was mainly to swampland. Flash flooding occurred in and near Florence, S. C., on the 16th. Streets in low areas were affected by shallow flooding, with one underpass impassable. A trailer court à few miles west of Florence was flooded, with water entering some trailers. Damage was mostly to trailers.

Heavy rains on the 17th caused minor flooding on the Savannah River at Clyo, Ga., on the 20th-27th. The Ogeechee River at Eden, Ga., reached bankfull stage on the 23d. Damage from the high water was slight.

The Oconee River at Milledgeville, Ga., rose 4.2 feet above flood stage on the 17th. The Satilla River at Waycross, Ga., was out of its banks on the 20th-24th. The crest on the 21st was 0.5 foot above flood stage. No damage resulted as mostly lowland was flooded.

EAST GULF OF MEXICO DRAINAGE

Heavy rains during the last week of July and the first part of August caused light flooding on the Apalachicola River in northwest Florida. The river remained above flood level at Blountstown, Fla., from the 2d through the 7th.

Heavy shower activity during the latter part of July and the first part of August caused the Pearl River to rise above flood stage at Bogalusa, La., on Aug. 2-9. Discharge from the Ross Barnett Reservoir produced above flood stage readings at Jackson, Miss., from July 29 to Aug. 5. The highest stage at Jackson was 23.9 feet (flood stage, 18 feet) on July 31. No flooding occurred in the city of Jackson, as the levee system around the city contained the overflow.

A thundershower just north of Meridian, Miss., on the evening of July 31 produced very heavy rains in a short period of time. A survey by U. S. Geological Survey showed that amounts of 7 to 10 inches fell in an area about 3 miles in diameter. Sowashee Creek rose rapidly, inundating shopping centers and light industry that had been built along its banks. Damage was sustained by over 500 houses in that city. A great many automobiles were inundated; streets and bridges were damaged by the high water. Damage to the area was estimated at about $1.5 million by Civil Defense, Red Cross, and Meridian City engineers.

MISSISSIPPI SYSTEM

Missouri Basin--Heavy rains on Aug. 30 produced flash flooding in the Yellowstone Drainage on Big Timber Creek in central Montana. This is one of the major drainage streams of the Crazy Mountains. The approaches to most bridges over the creek were washed out. A few ranches reported basement flooding. Considerable debris was deposited on croplands along the creek. The total damages were estimated at $166,000.

Ohio Basin-- The Licking River at Salyersville, Ky., rose 2 feet above flood stage during the night of Aug. 4-5. There was a considerable amount of flash flooding over the valley. Heavy local thunderstorms over the Mash Fork, State Fork, and Burning Fork caused heavy flow into the Licking in and near Salyersville. It was reported that the outflow from these tributaries was so heavy at one time that it caused the Licking to flow backward upstream from the town. The water rose 2 to 3.5 feet deep in many streets and yards.

Most of the damage from this flood occurred around Salyersville, Ky. Fifty to 60 families were evacuated from their homes. Preliminary estimates indicate the damage at $1 million.

White Basin--The flooding on the Cache River at Patterson, Ark., in the beginning of the month was due to 3 to 4 inches of rain on July 23-24. Additional rains of 3 to 4 inches on Aug. 3-4 produced an additional rise to a crest of 8.5 feet (flood stage, 7 feet) at Patterson on Aug. 7. The Cache remained above flood stage until Aug. 16.

Arkansas Basin--A small intense storm on the 6th caused brief flash flooding on the Salt Fork of the Arkansas River between Pond Creek and Medford, Okla. A total of 3.73 inches of rainfall was reported at Medford, Okla., on the 6th.

Locally heavy thunderstorm activity on the 15th produced some flash flooding in Colorado on Pueblo's north side and Belmont areas. Reports indicated that a basement of one home was flooded, but no major damage was reported. Some of the flooding of streets was due to clogged drains.

Flash flood warnings were issued on the 19th for portions of southern Crowley and northern Otero Counties in southeastern Colorado. Reports of 1.45 inches of rain and some flooding of aroyos and small streams was reported to have occurred 13 miles northwest of Timpas in Otero County.

Brief flash flooding occurred east of Ponca City, Okla., and west of Cleveland, Okla., due to heavy rains on the 22d. The rain averaged about 3 inches from south-central Kansas southeastward to Tulsa, Okla. Slight rises resulted on the Arkansas River at Ponca City, and Ralston, Okla. Minor rises occurred at Heyburn and Keystone Reservoirs.

Heavy rains on the 28th in Colorado caused some flooding along highway 101 in Los Animas County. In downtown Salida, Colo., in southeastern Chaffee County, several homes were evacuated due to high water resulting from 4 inches of rain. Some damage resulted to the local lumber yard.

Red Basin--Heavy thunderstorm activity in southwestern Oklahoma and northwestern Texas late on the 14th and early on the 15th caused flooding on the Wichita River at Wichita Falls, Tex. It crested 2.4 feet above flood stage on the 15th and receded within its banks on the 16th.

The Salt Fork of the Red River at Mangum, Okla., rose to near flood stage on the morning of the 15th. West Cache Creek and Deep Red Run near Randlett, Okla., rose briefly out of their banks on the 15th.

Damage from flash floods resulting from the heavy rains on the 14th-15th in Cotton County, Oklahoma, was estimated at $500,000.

Minor flooding occurred on the Sulphur River in northeastern Texas on the 15th. The crest at Hagansport, Tex., was 1.5 feet above flood stage.

WEST GULF OF MEXICO DRAINAGE

Above normal rainfall during August over the upper Trinity and upper Brazos River Basins ended the severe to extreme drought conditions and produced moderate to sharp rises on major streams. Bushy Elm Creek overflowed east of Muenster, Tex., during the morning of the 14th. Water was reported 3 feet deep around a trailer court east of Muenster. Joes Creek in north Dallas also overflowed, stalling cars with the water rising above curb level in a shopping center on the morning of the 14th. Heavy rains beginning during the night of the 23d caused Clear Fork, a tributary of the Brazos, above Possum Kingdom Reservoir, to rise out of its banks at Leuders, Tex., on the 24th.

Rainfall of 2 to 5 inches during the evening of the 1st and the morning of the 2d caused about 5 feet of overflow on the San Saba River at San Saba, Tex., on the 2d. No significant damages resulted from this overflow. A general rain of 2 to 4 inches on the 11th-12th caused the Llano River at Llano, Tex., to overflow its banks. It remained about 2 feet above flood stage on the 12th-13th. There was no significant damage.

Heavy rains on the 5th-6th caused minor flooding on the Navidad River at Ganado, Tex., and on the Lavaca River at Edna, Tex. The heaviest rains occurred on the 6th with totals ranging from 2 to 4 inches. The flooding on the 6th-8th was restricted to lowlands and no significant damage was reported.

Heavy rainfall over the San Antonio, Tex., area on the 5th-6th and 12th-13th caused considerable flash flooding with heavy property damage and six deaths. The heavier rainfall occurred mainly west and north of San Antonio over the Medina and Nueces River basins. Most of the water above the Medina dam was impounded resulting in water coming over the spillway for the first time since 1961. The six deaths resulted when motorists attempted to ford flooded streams. Property damage, including damage to roads and bridges, was estimated at $1 million or more.

The heavy rains over the middle and upper Nueces Basins during the first week of August and near the middle of the month, caused flooding along most of the tributaries and main streams. The rainfall during the first period ranged from 4 to 7 inches in the Nueces Basin. Water from the Nueces, Frio, and Atascosa Rivers combined to cause moderate flooding on the Nueces from Three Rivers, Tex., to Lake Corpus Christi beginning on the 11th and 12th. Rains over

2 to 4 inches on the morning of the 1st caused flash flooding on lower Hondo Creek in Medina County, with a 9-foot rise above Hondo, Tex.

Up to 15 inches of rain on the morning of the 11th in the upper Nueces caused flash flooding on the West Nueces in the Uvalde, Tex., area and above. Very heavy rains on the morning of the 12th caused flash flooding on Hondo and Seco Creeks. Val Verde Creek tributary to Hondo Creek, reported its highest flood since 1919. Extensive flooding isolated the town of D'Hanis on the 13th, cutting off the escape for more than 300 persons, about half the population, who took refuge in second-story buildings. More than 1,000 persons evacuated from D'Hanis and Hondo. Two drownings occurred in Sabinal River near Utopia and one on a flooded road in Medina County. Extensive flooding entered the Frio, augmented by water which came down the Leona River from near Uvalde, and moved down past Derby on the 14th and 15th and reached Fowlerton on the 16th, Tilden on the 17th, Calliham on the 18th, and Three Rivers on the 19th. The flooding on the lower Frio was comparable to that following Hurricane Beulah in September 1967, and was about 3-1/2 feet lower than the flood of 1932. In Tilden, most streets and roads were closed, with water up to 2-1/2 feet deep in city streets, and 200 persons were displaced. Water from the Frio entered the town of Three Rivers and caused some street flooding.

Moderate flooding occurred along the Nueces during most of August. The crests ranged from 7 feet above flood stage at Uvalde, Tex., on the 11th to 17 feet above flood stage near Mathis, Tex., on the 23d. The extreme lower Nueces was in flood for about 4 weeks from early in the second week of August to near the end of the first week of September. At Calallen, Tex., the crest on the 26th was 3.6 feet above flood stage.

Drainage flooding resulted from very heavy rains near the Texas coast in the first week. The heaviest rainfall totaled 14 inches at Robstown on the 2d and 3d and caused extensive street flooding and evacuation of 400 persons from their homes. Flash flooding occurred repeatedly from rains ranging up to 7 to 9 inches in Corpus Christi and in the area within about 25 miles. Streets were heavily flooded in parts of Corpus Christi on the 2d and again on the 5th, with up to 3 feet of water on many residential streets. Damage was extensive to automobiles.

The total damages in the Nueces Basin were estimated at $1.7 million. There were three deaths as a direct result of floods.

GULF OF CALIFORNIA DRAINAGE

Colorado Basin--Flash floods were frequent during August in the San Pedro River basin, and in the vicinity of Tucson, Ariz. Sharp rises occurred in one or both of these areas on 26 days. Flooding occurred at other points in southeastern Arizona but the frequency of floods in those areas was not as high. Several small streams in the Tucson area, that generally have flow only once every 2 or 3 years, had as many as four peaks during August. The U. S. Geological Survey reported the highest flow during 6 to 10 years of record at 13 stations in southeastern Arizona.

Thirteen people were stranded in Harquahala Valley, 70 miles west of Phoenix, Ariz., on the 19th as flood water runoff from the Big Horn Mountains threatened to rip structures from foundations during the evening. One rancher reported the flooding was the worst he had ever seen in the valley. In Tucson, Ariz., runoff water was estimated to be the worst in 13 years causing extensive damage to county roads and city streets. Heavy rain through the Mohave Valley during the late night of the 19th closed all highways as flash floods occurred in almost every wash. Damage was estimated at $100,000.

Heavy rain on the 20th in Casa Grande isolated some subdivision homes. The Gila River near Coolidge, Ariz., ran bankfull due to 1.55 inches of rain in 1-1/2 hours. Runoff from Sacaton and Superstition Mountains closed many county roads. Heavy rain in the Wenden, Ariz., area turned washes and roadways into swirling turbulent waves of water. Sections of Bright Angel Trail in Grand Canyon National Park washed out. Casa Grande was flooded again early on the evening of the 21st. Heavy flooding occurred at Safford, Pima, and Thatcher, Ariz., due to heavy rain (1.89 inches at Safford in 55 minutes). Many road closures were reported in Maricopa County. Local flooding occurred in Somerton, Ariz.

The total damages from flash floods in Arizona during August were estimated at around $2 million by the Soil Conservation.

GREAT BASIN

Flash flooding occurred at many places throughout Utah and at a few places in Nevada during August. The most damaging flood in Utah occurred in the vicinity of Minersville on the 21st, when a diversion canal was damaged by debris. A school and several residences were flooded. This overflow resulted from 2.2 inches of rain that occurred within a 45-minute period.

Thundershower activity caused flash flooding at Genoa, Nev., on the 5th. Flood damages were estimated at many thousands of dollars.

ALASKA

Heavy rainfall on Aug. 6-9 caused major flooding on the Matanuska and Susitna Rivers.

The Matanuska River near Palmer, Alaska, crested at a record stage of 13.3 feet on the 10th. This was the highest stage recorded at Palmer since records began in 1949. The previous highest stage was 12 feet recorded in 1949. Analysis of the flood hydrograph for the Matanuska River revealed that a natural earth dam had burst in the upper headwaters of Granite Creek. This lake breakout resulted in additional huge volume of waters that surged across the flood plain of the Matanuska River causing major erosion and high water damages.

The Susitna River exceeded flood stage near Sunshine, Alaska, on the 10th. The main flood damage was the washing out of railroad tracks. Washouts were reported by the Alaska Railroad at Houston, Alaska, near the Little Susitna River and in two areas along the Susitna River.

The heavy rainfall on the 6th-9th in the Anchorage, Alaska, area caused damage to Ship Creek Bridge near Ft. Richardson's main gate on the Glenn Highway. The bridge was closed by the Highway Department. The U. S. Army installed a Bailey bridge to maintain traffic. A dirt access road was washed out by Peters Creek near Mile 21 on the Glenn Highway, isolating three homes.

Damage from flash flooding in south-central Alaska was quite extensive. Because of the steep gradient of the Matanuska River, streamflow velocities were extremely high causing erosional damage, such as highway and bridge abutment washouts, as well as to the flood plain. There were approximately 124 houses,

trailer homes, and business establishments that suffered some degree of flood damage. The Alaska Disaster Office estimated the total flood damage at $5.8 million, making this Alaska's second most damaging flood.

Heavy rainfall on the north and west sides of the Alaska range caused minor flooding on the Kuskokwim and Tanana Rivers between the 10th-14th. These minor overflows were due to rainfall that came from the same storm that caused major flooding along the Matanuska and Susitna Rivers.

The Kuskokwim River exceeded flood stage at Nikolai, Alaska, during the evening of the 10th and crested 24 hours later 0.5 foot above flood stage. Approximately one-half of the village was under water. At McGrath, the river crested at a stage of 21.5 feet (near bankfull) on the 15th. The crest moved downstream slowly, reaching the Bethel area on the 20th. The Tanana River crested at Big Delta at 67.5 feet, 0.5 foot below flood stage on the 11th. The crest moved downstream reaching Harding Hill on the 12th and Nenana on the 13th. The crest at Nenana was almost 1 foot above flood stage. There was no reported damage at Nenana and although water entered houses at Nikolai, the extent of damage is not known.

PUERTO RICO

Heavy rains over the eastern portion of Puerto Rico on the 23d-24th caused flooding along the Humacao, Valenciano, Gurabo, and Munabo Rivers early on the 24th.

The heavy rains were due to a tropical depression that moved through the northeastern portion of the island on the 24th. The heaviest rainfall was centered around Humacao and the southeastern coastal areas, where 6.7 inches occurred late on the 23d and early on the 24th. A total of 9.19 inches fell during the week ending the 27th. Less than 1 inch occurred in the western portion of the island and little or none in the northwestern coastal plain. The tropical depression, after passing Puerto Rico, later developed into tropical storm Doria that caused heavy rains and major flooding in New Jersey.

Some residents of Juncos and Gurabo were evacuated by the Civil Defense. Minor damages were reported to houses and agriculture in this area.

Note: All observations scheduled at 1200 G.c.t. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G.c.t.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun. AUGUST 1971

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter.

Values with an asterisk are interpolated.
U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska — AUGUST 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	67	103	248	199	65	50	52	21	29	87	178	202	83	154	185	198	110	116	70	102	177	98	149	39	103	108	149	91	80	48	145	113

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	NO DATA - MACHINE MALFUNCTION																															

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code ± s Ø Ø Ø defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i e, the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ø Ø Ø) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g, 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick. The code ± s designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), August

B. Temperature Departure from 30 - Year Mean (°F 1931-60), August 1971.

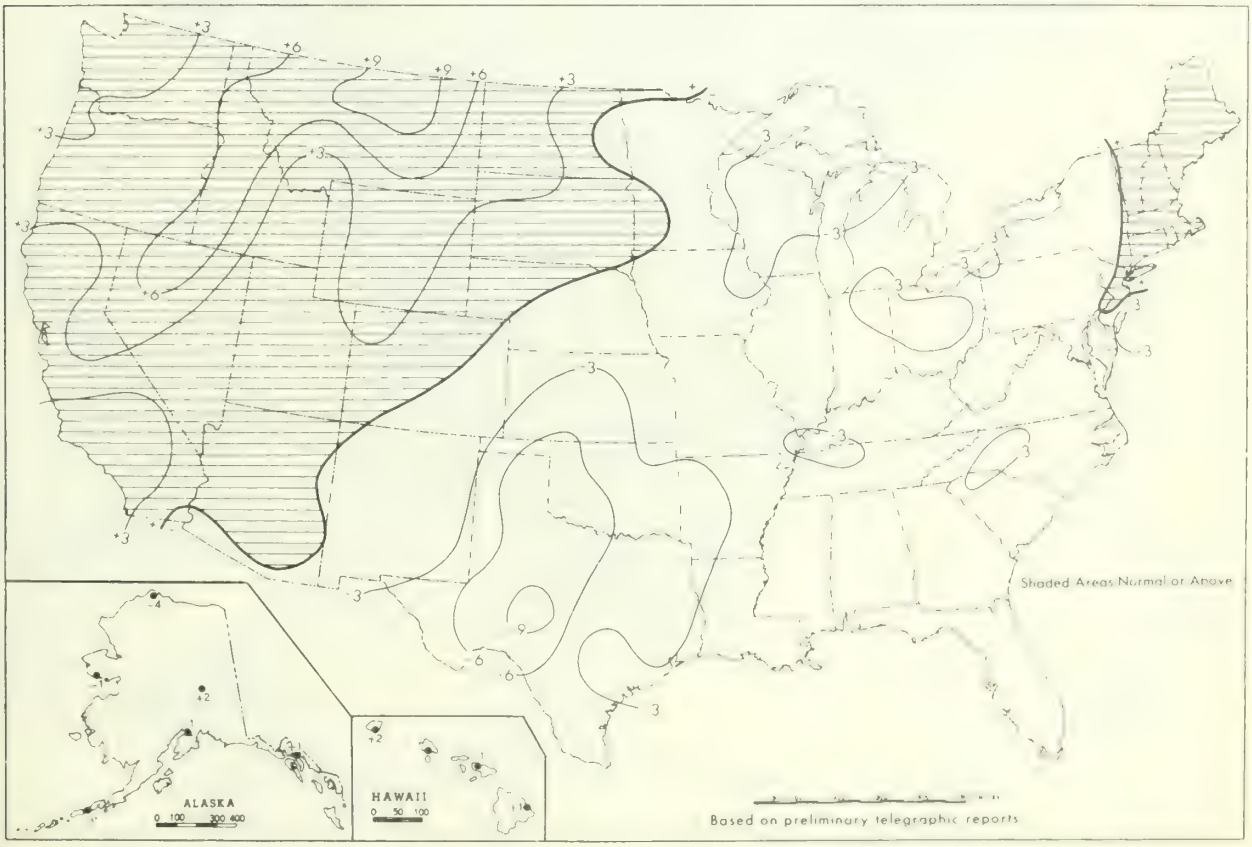

Chart II. Total Precipitation (Inches), **August 1971.**

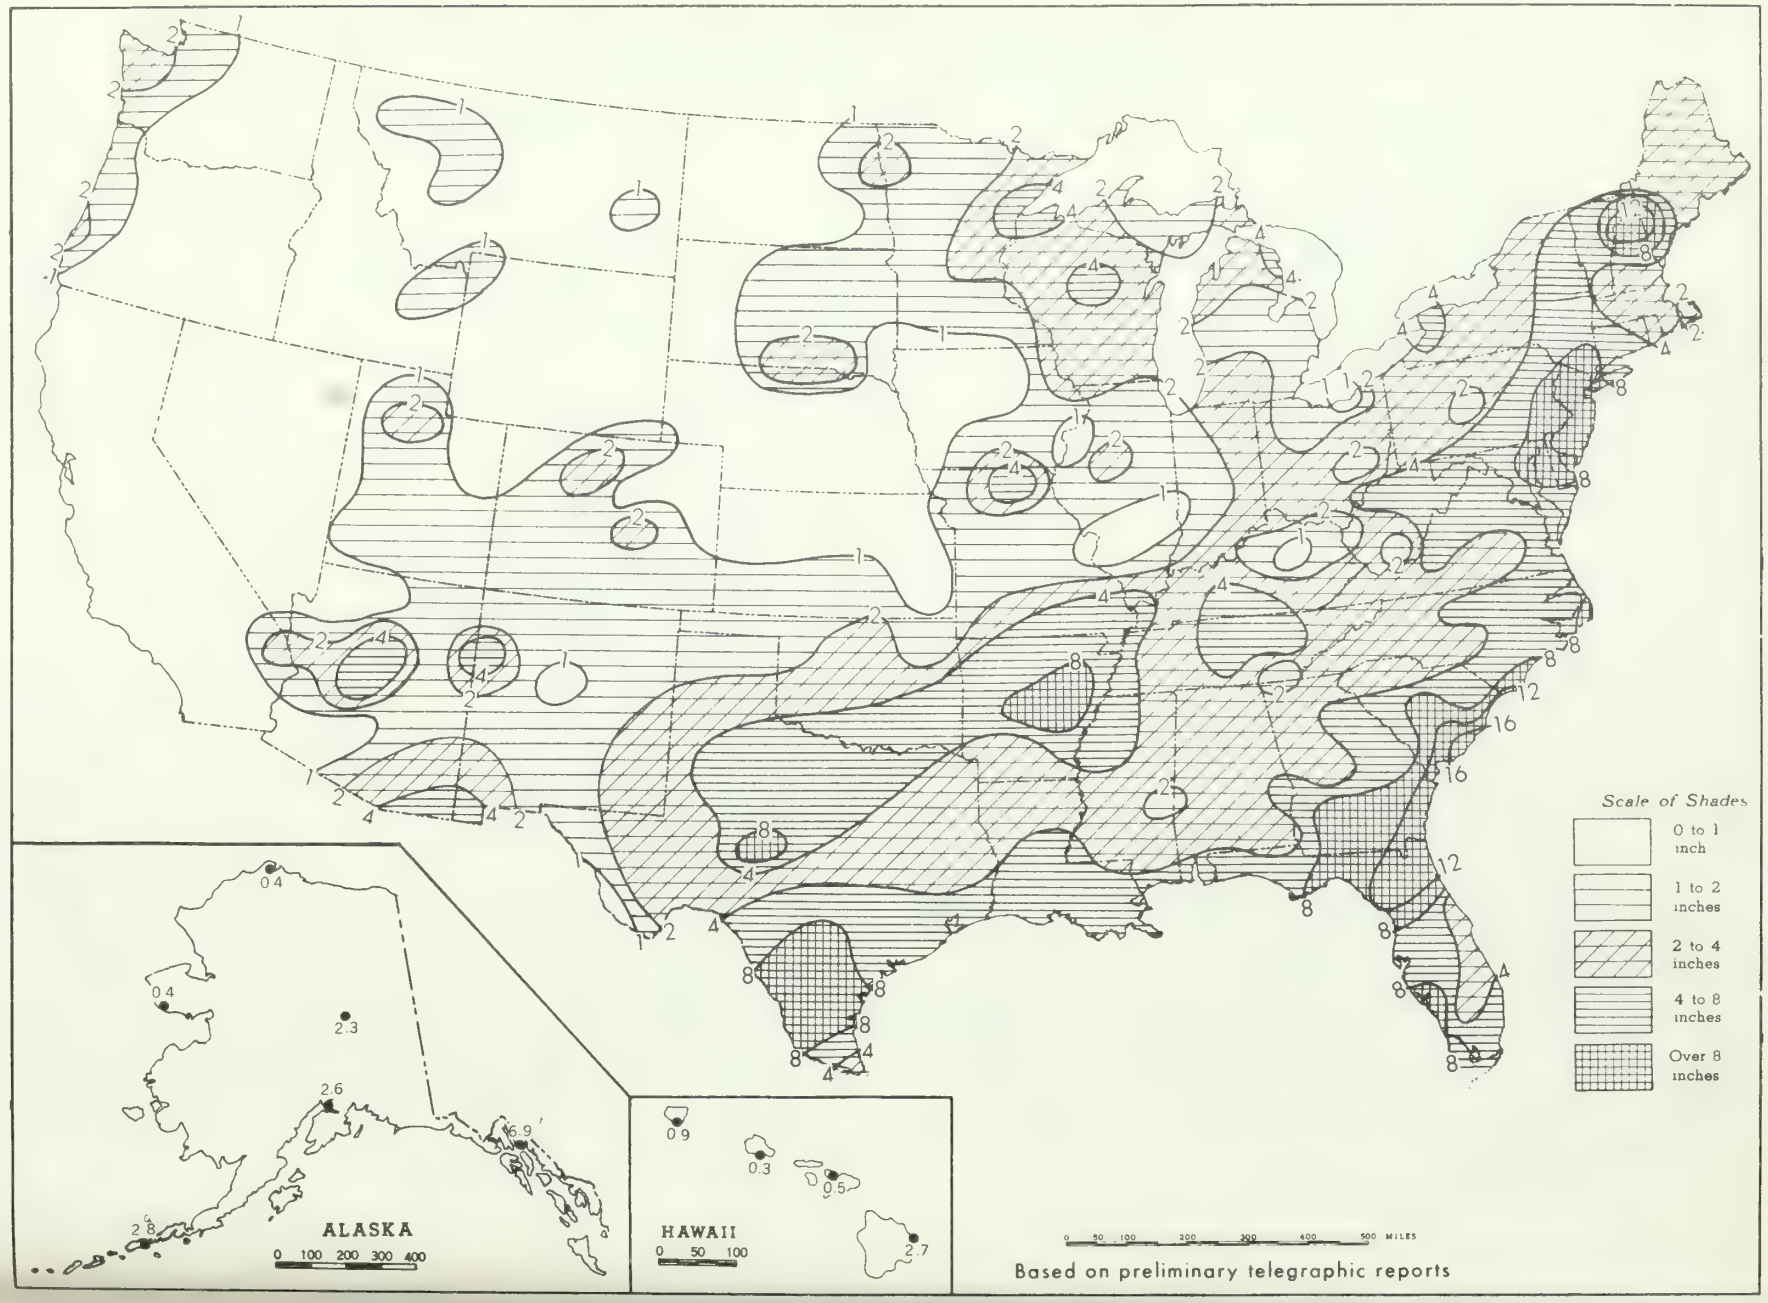

Chart III. Percentage of Normal Precipitation, **August 1971**.

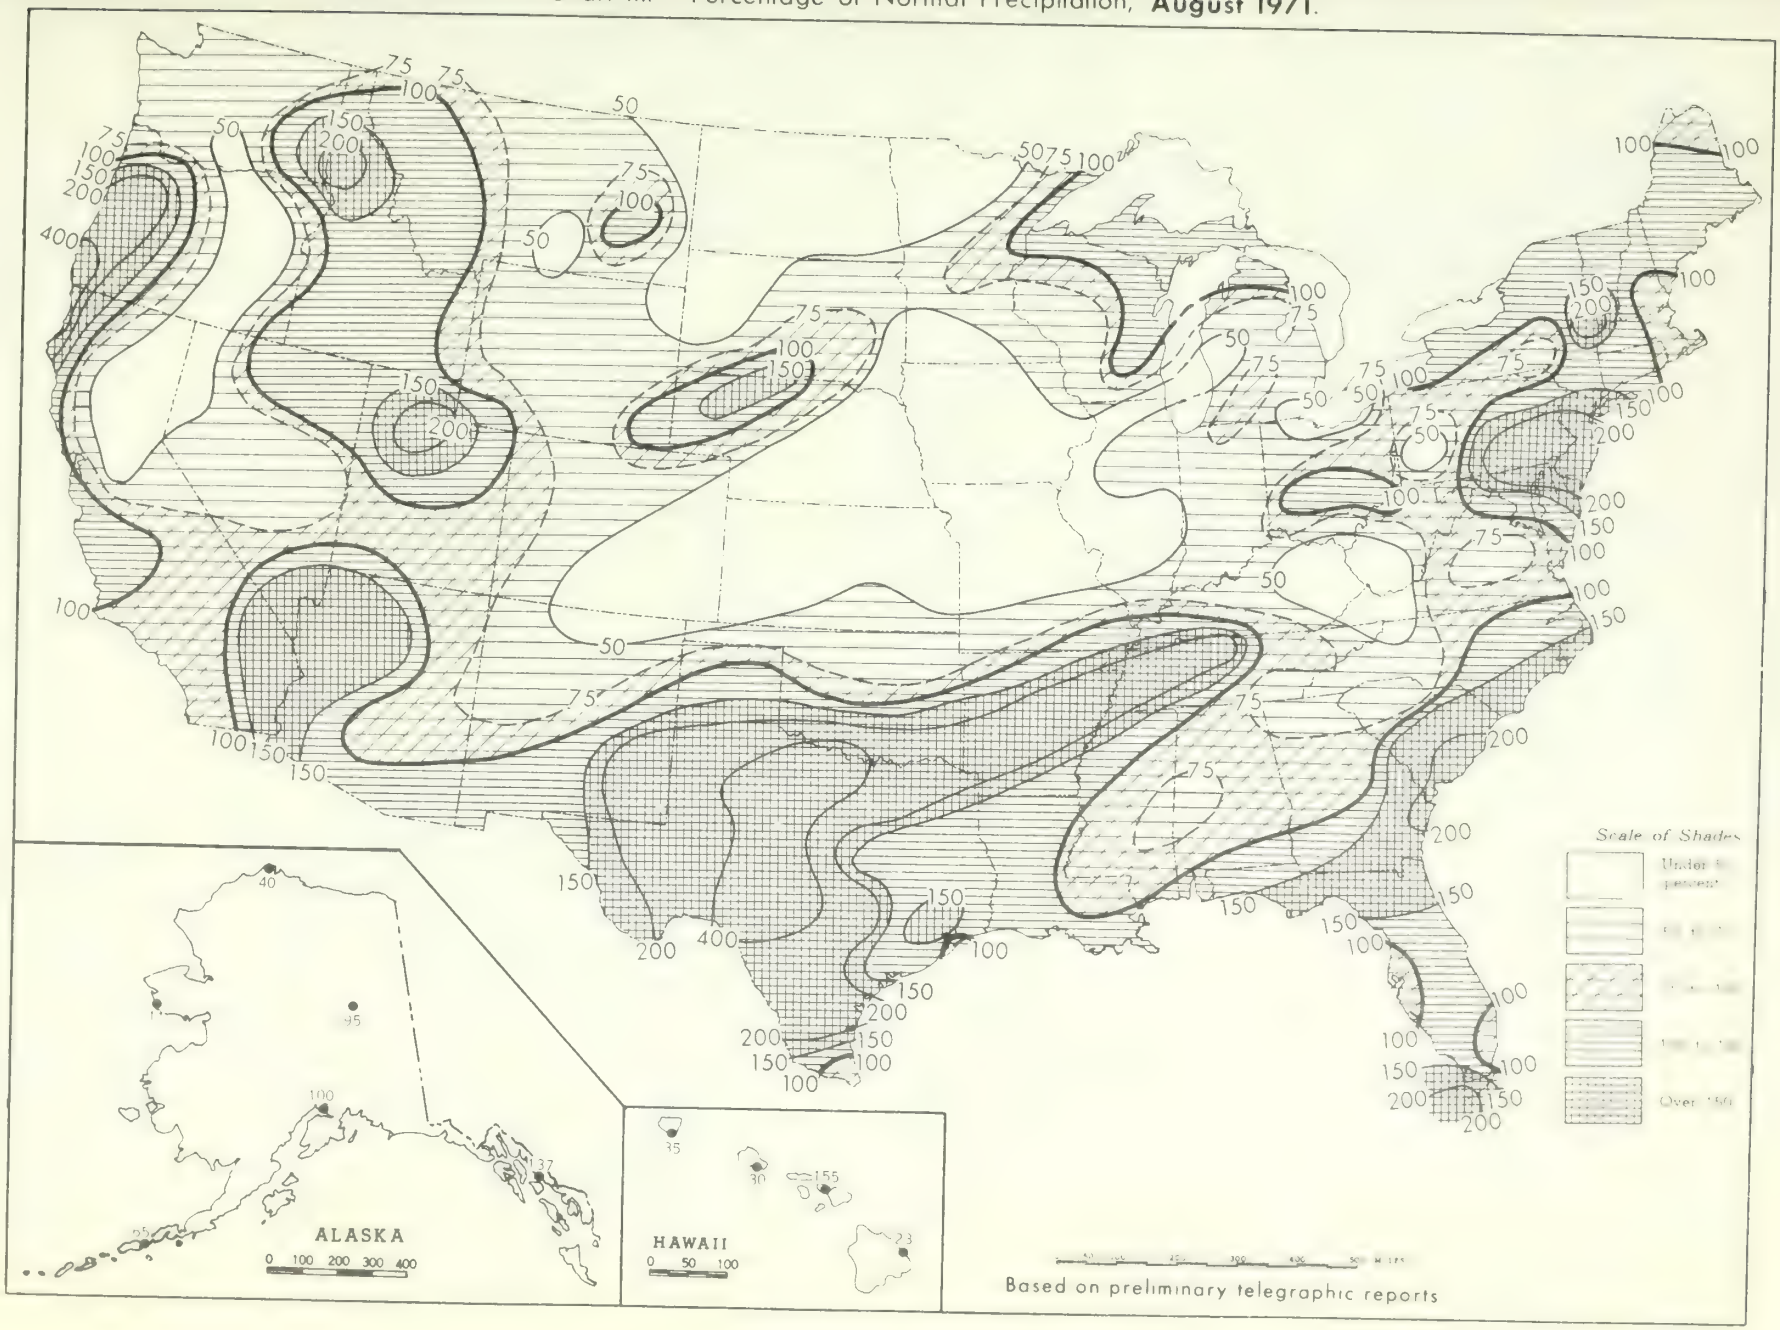

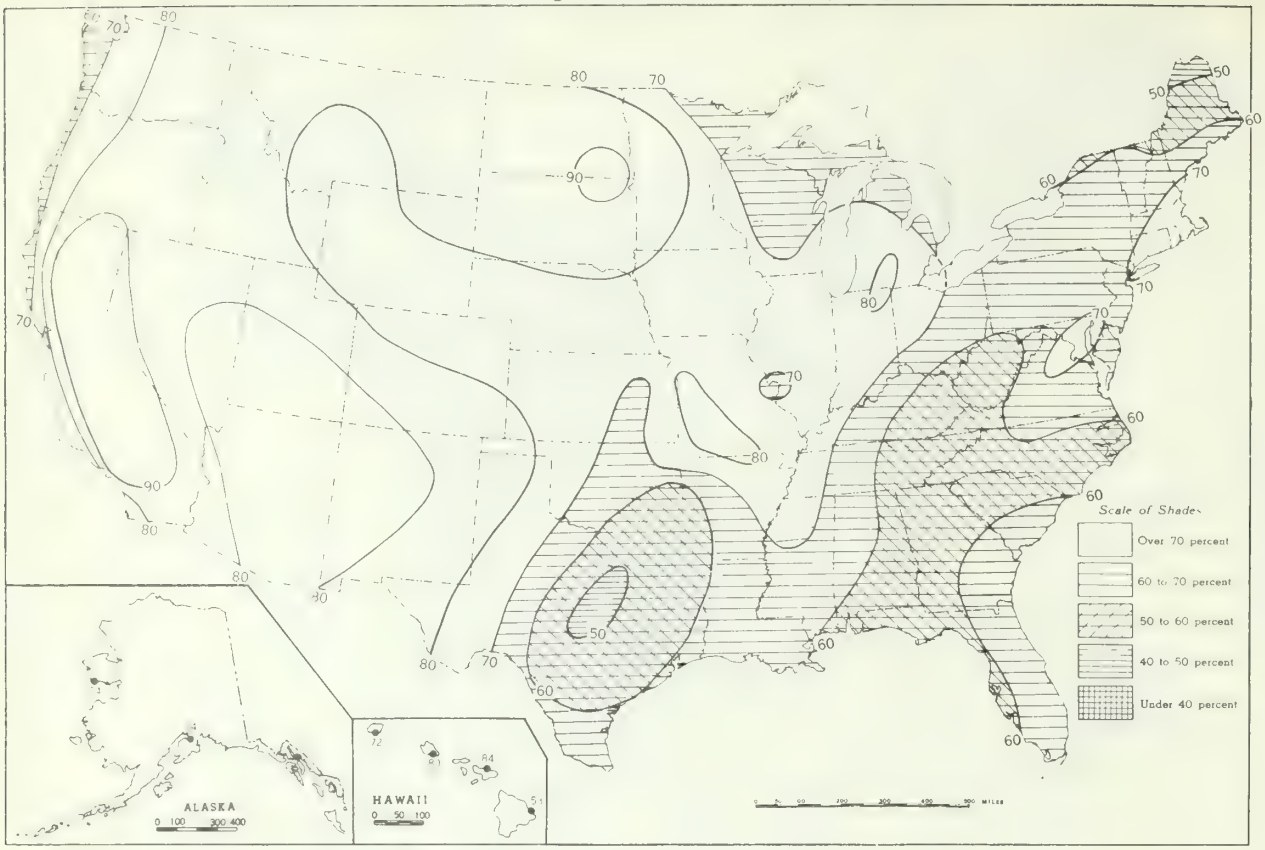

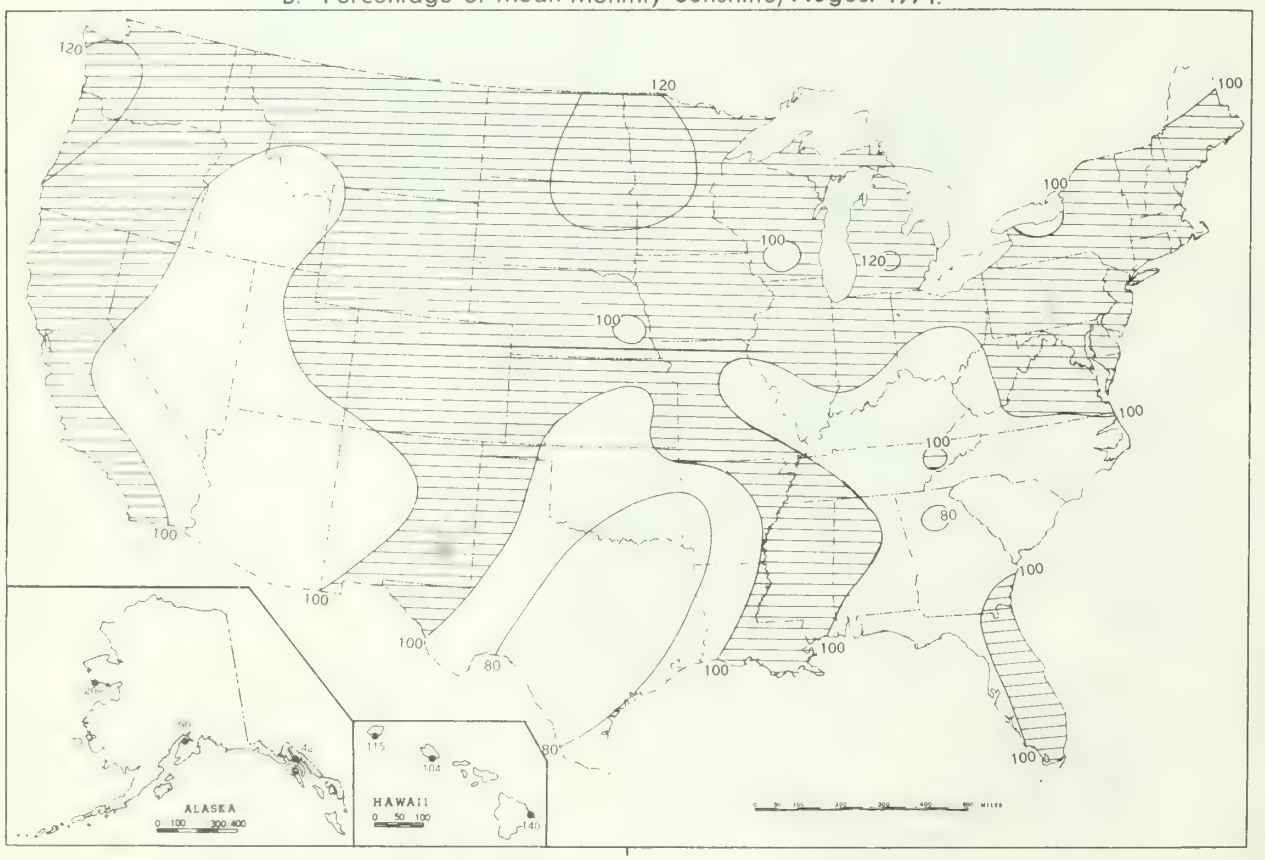

Chart VI. A. Percentage of Possible Sunshine, August 1971.

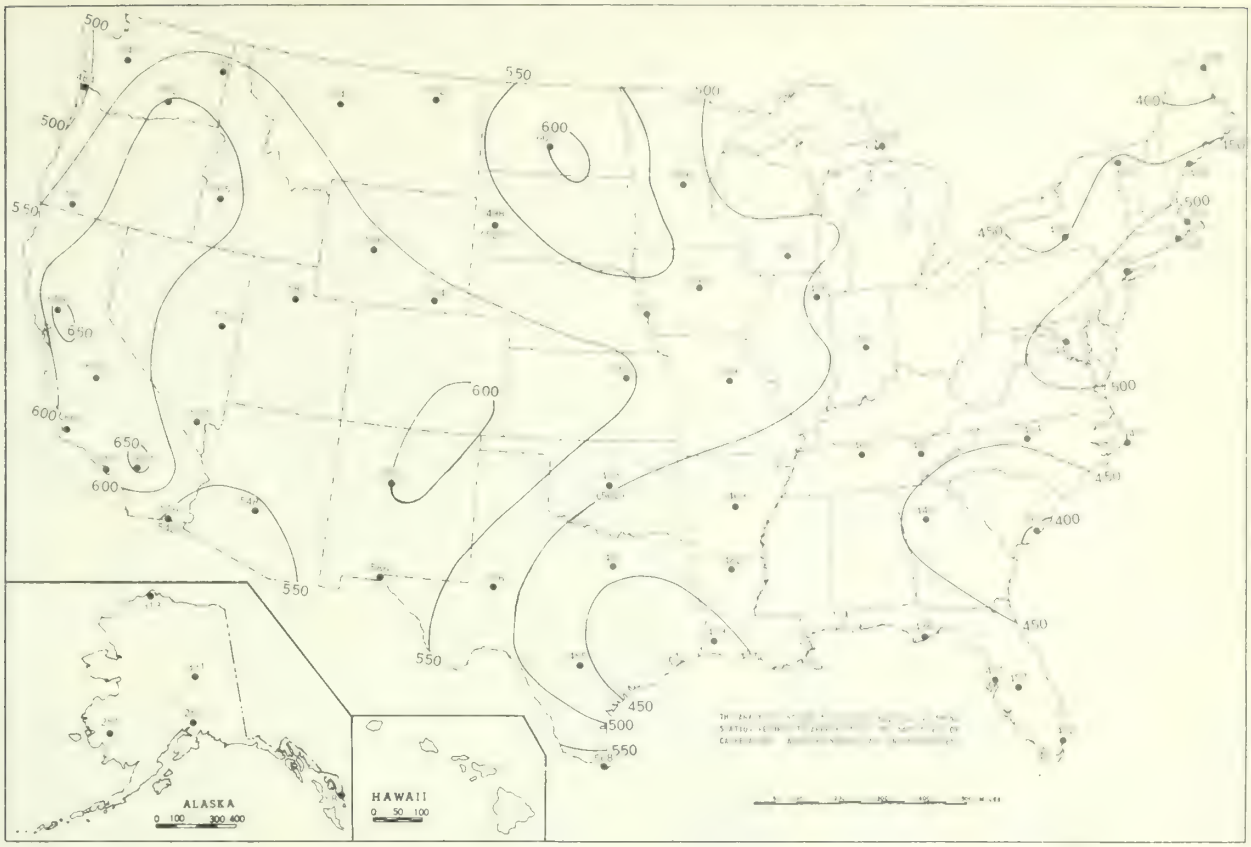
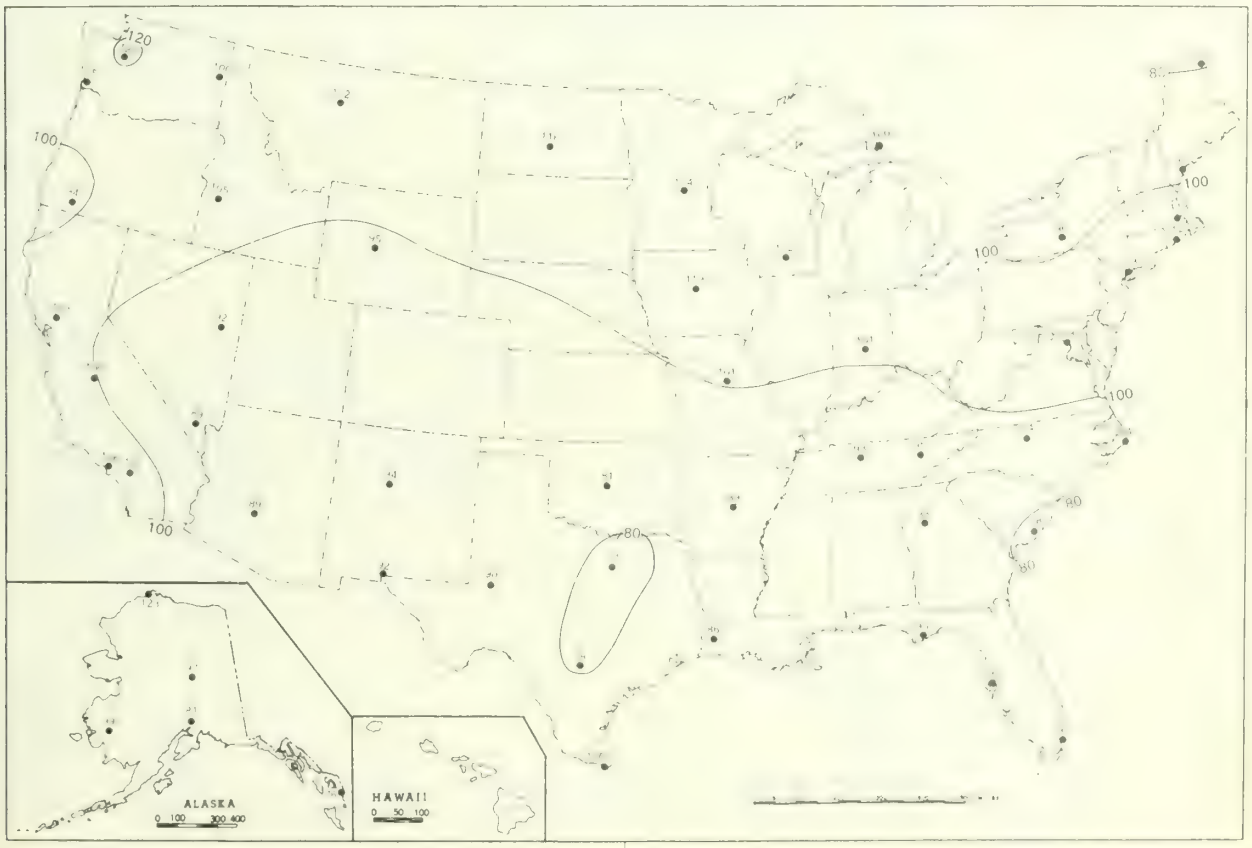


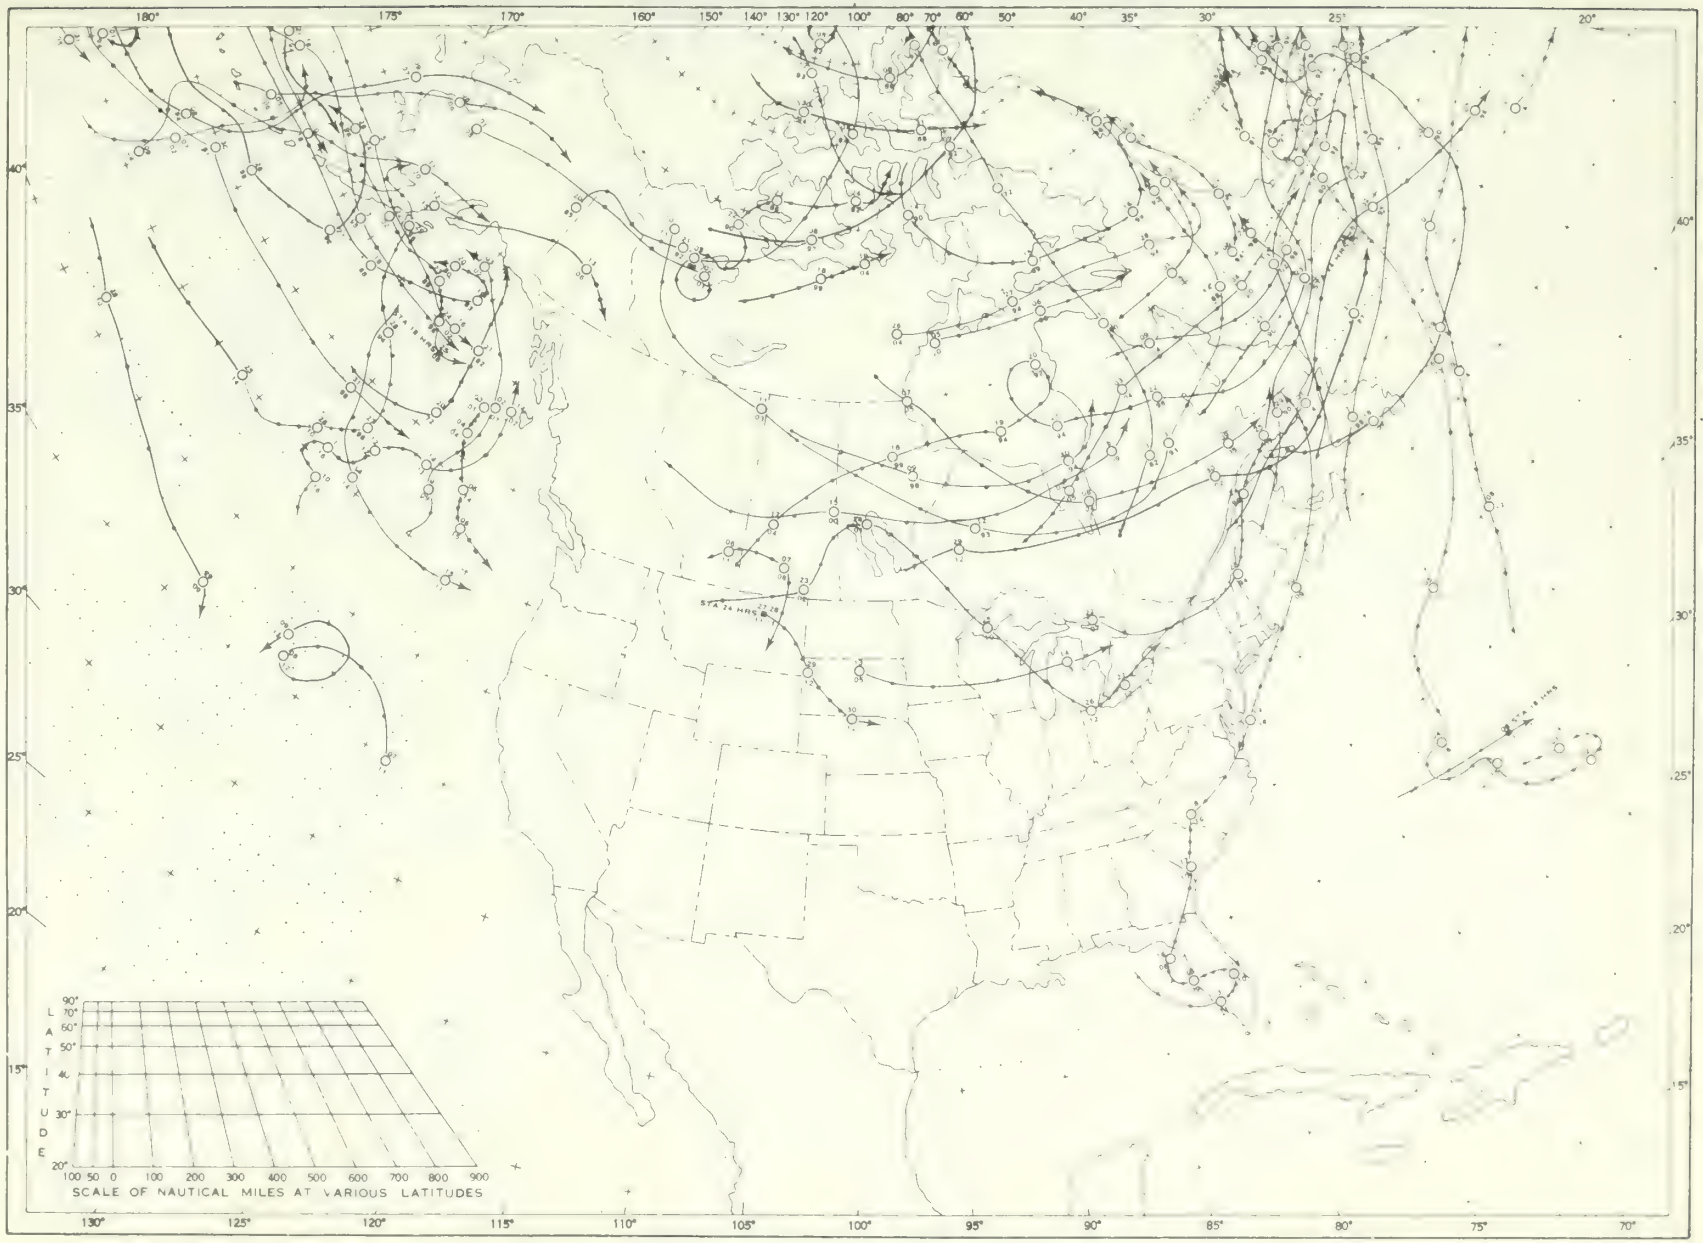
B. Percentage of Mean Monthly Sunshine, August 1971.



A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

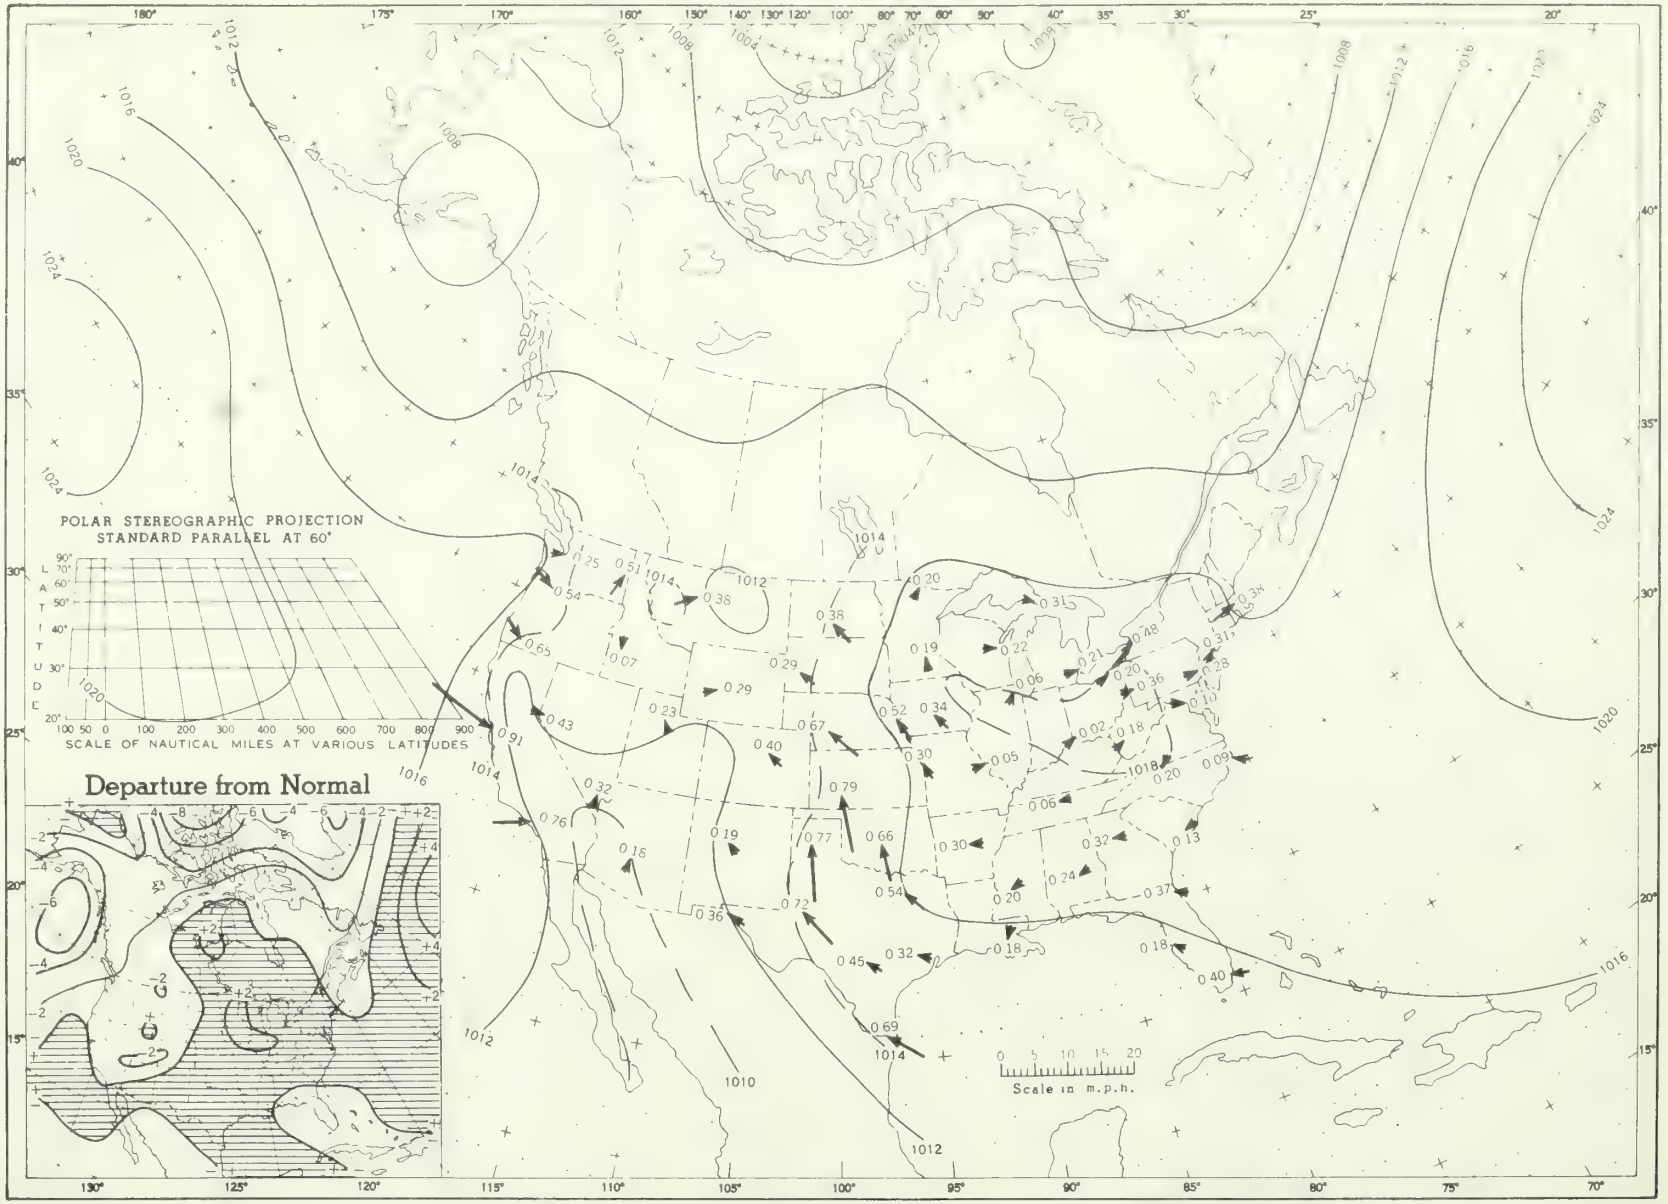
Chart VII. A. Average Daily Values of Solar Radiation, Langleys, August 1971.

B. Percentage of Mean Daily Solar Radiation, August 1971.



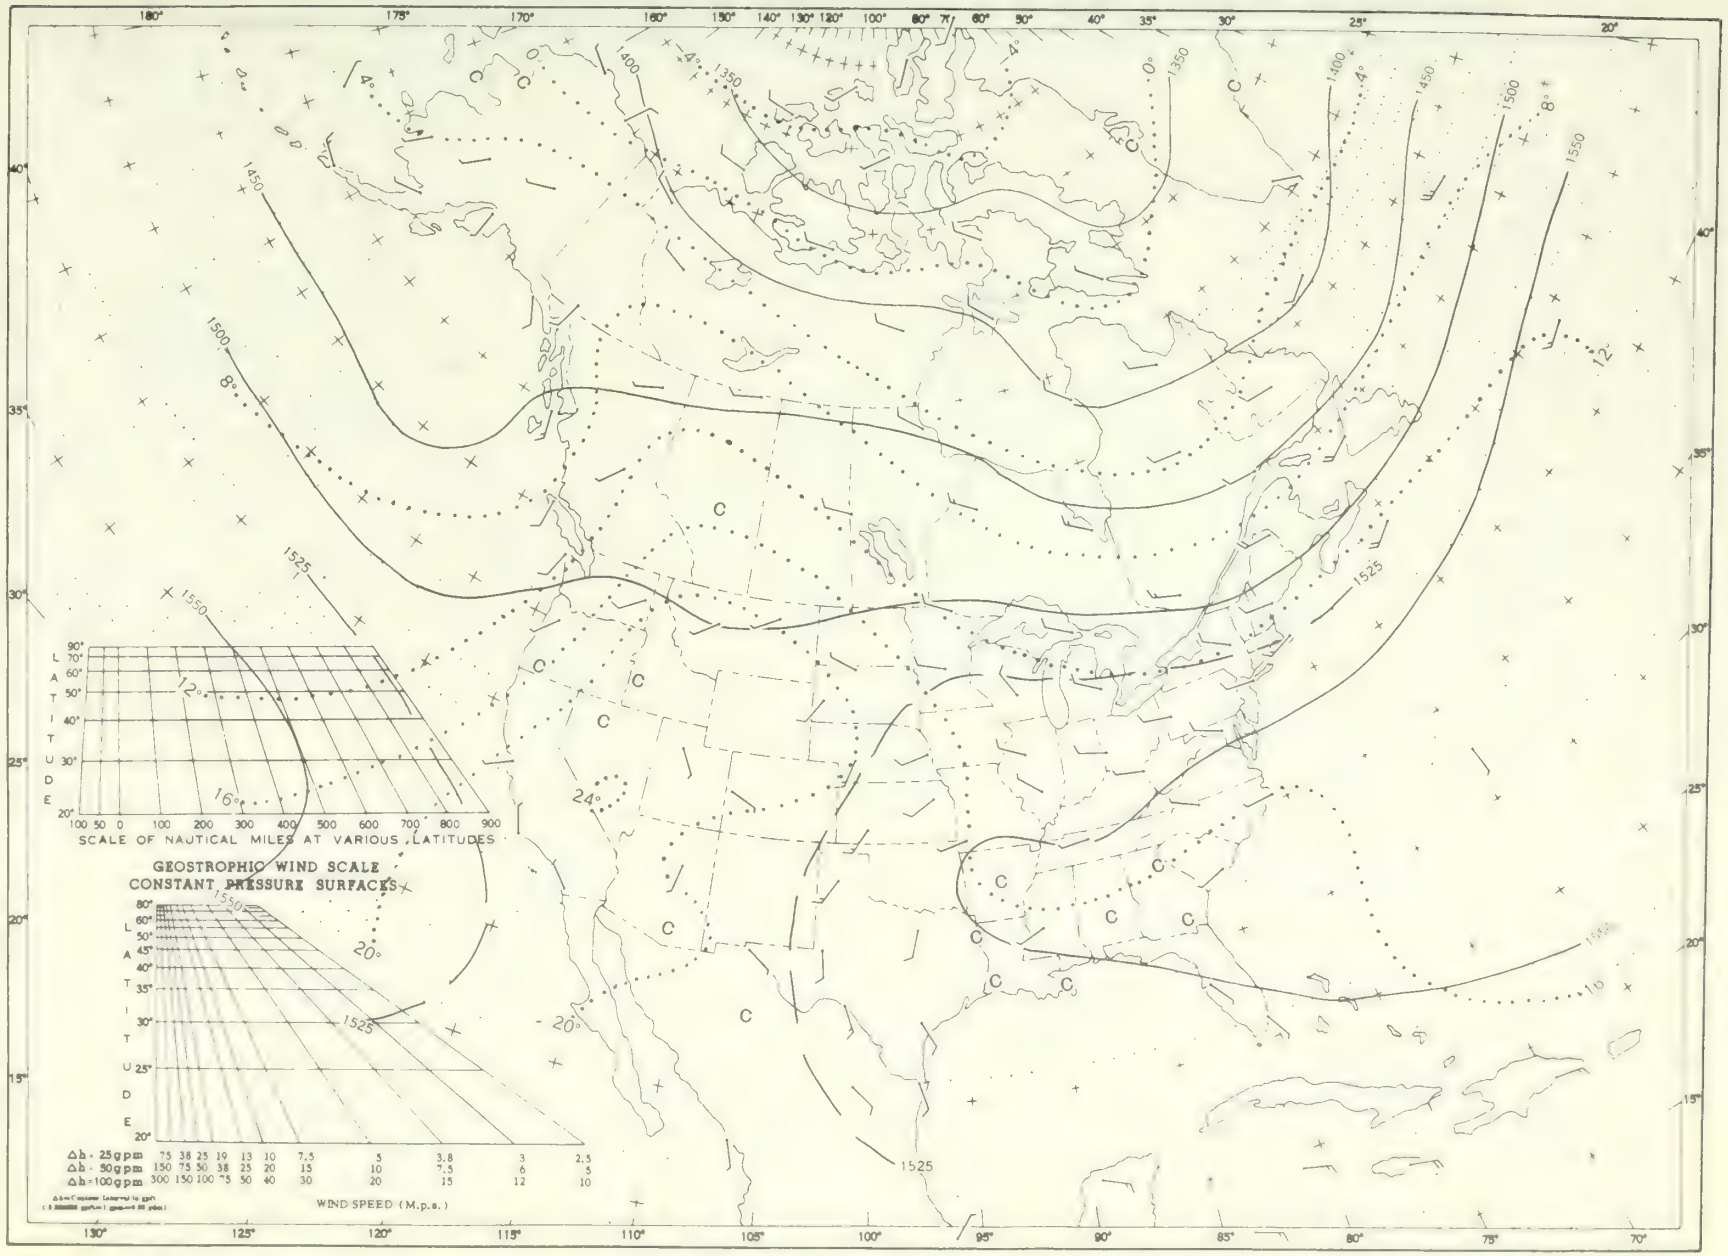
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, August 1971.



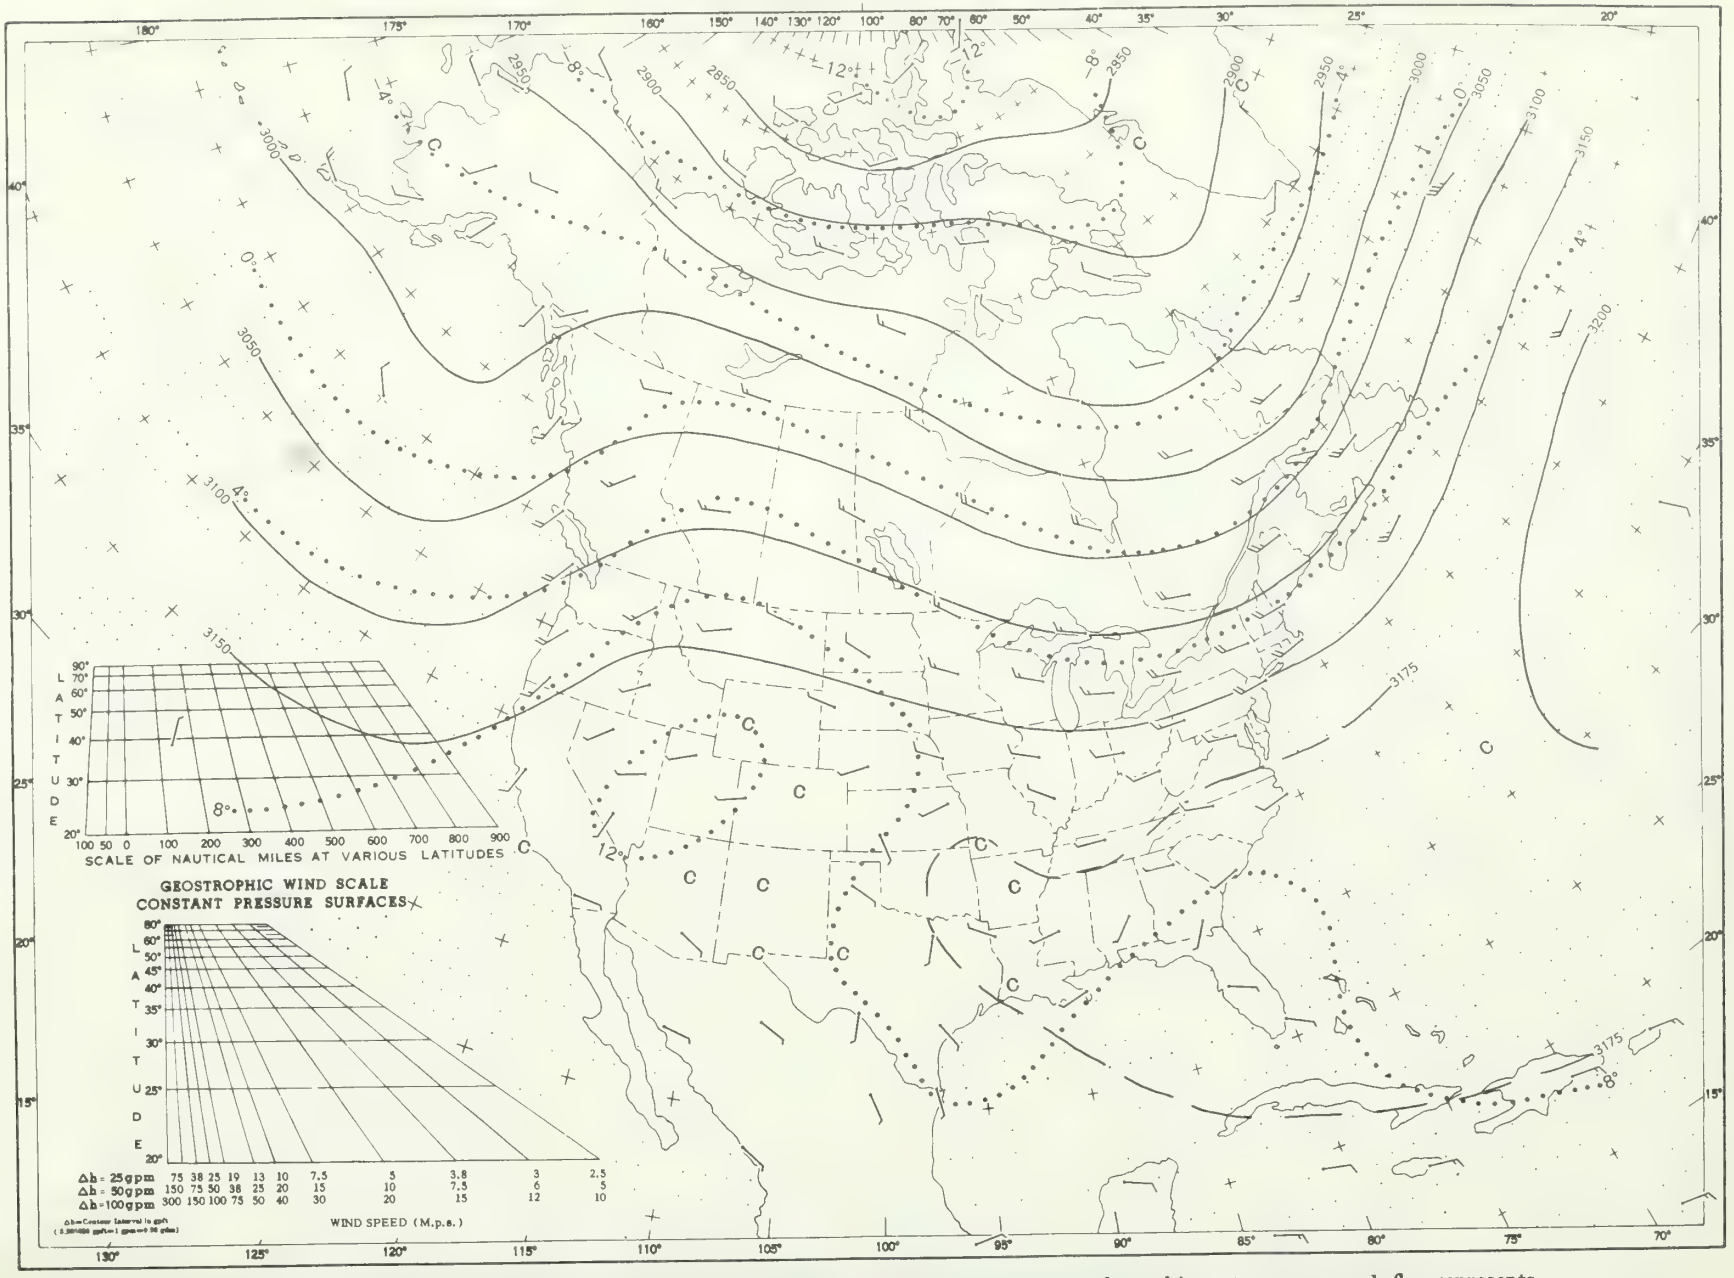
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, August 1971.



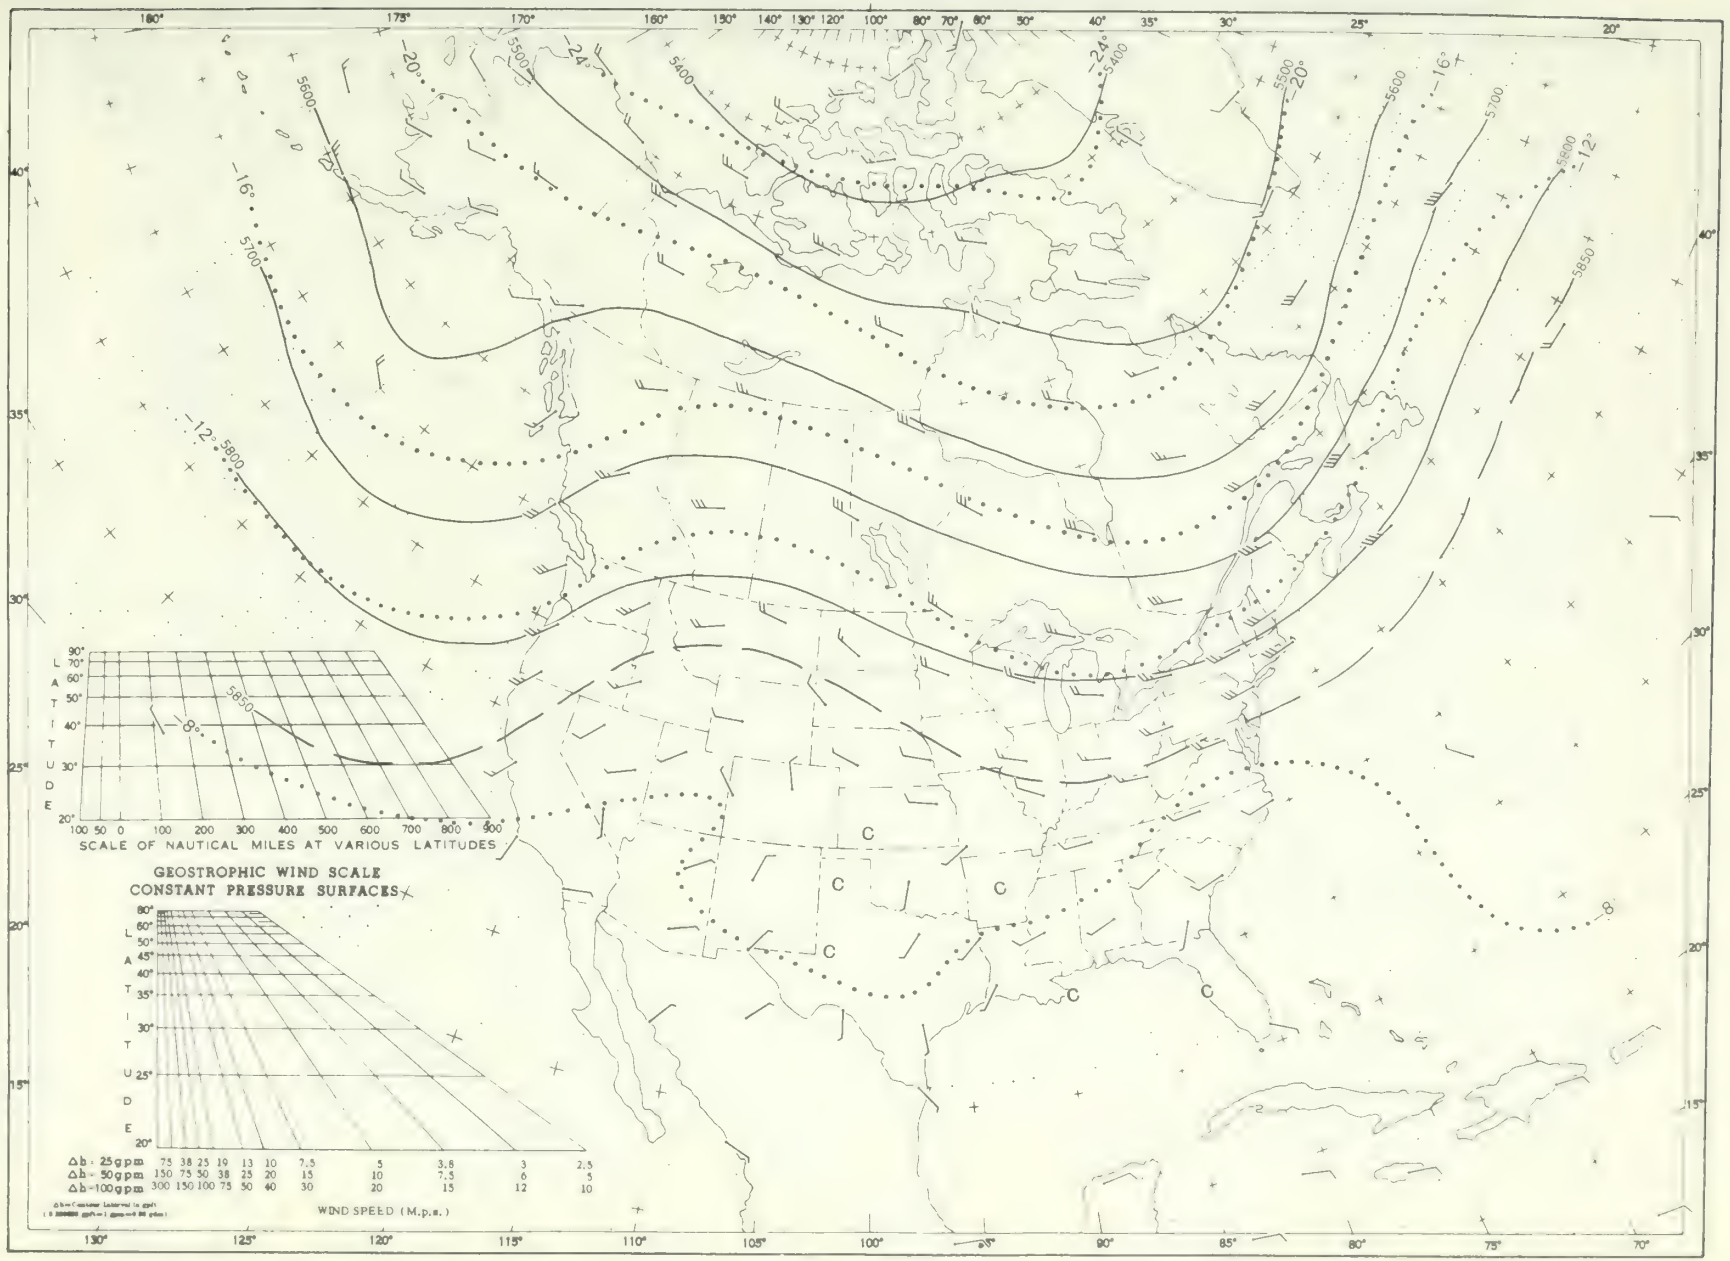
Circle indicates position of center at 7:00 a.m E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, August 1971. Inset Departure of Average Pressure (mb) from Normal, August 1971.



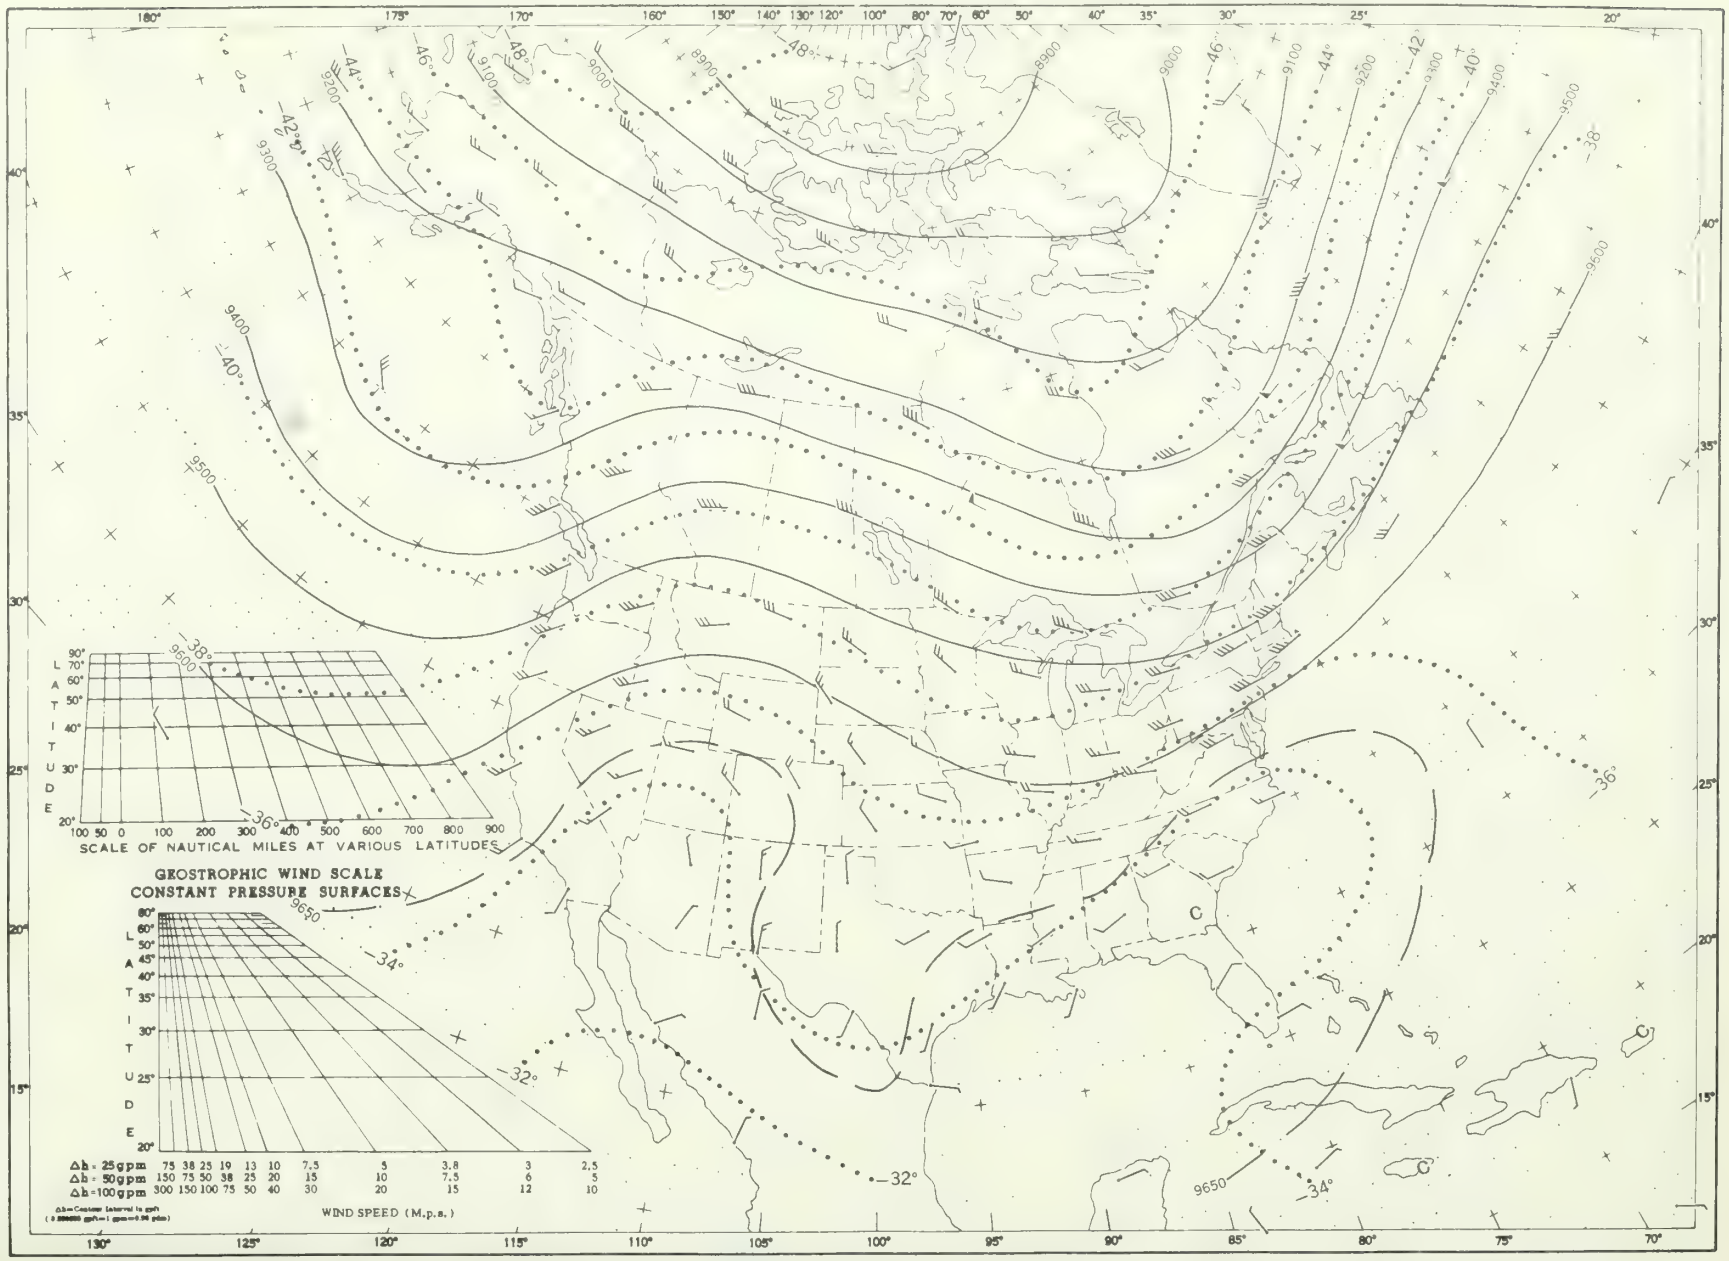
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI 850-mb Surface, 1200 G.m.t., **August 1971.** Average Height and Temperature, and Resultant Winds.



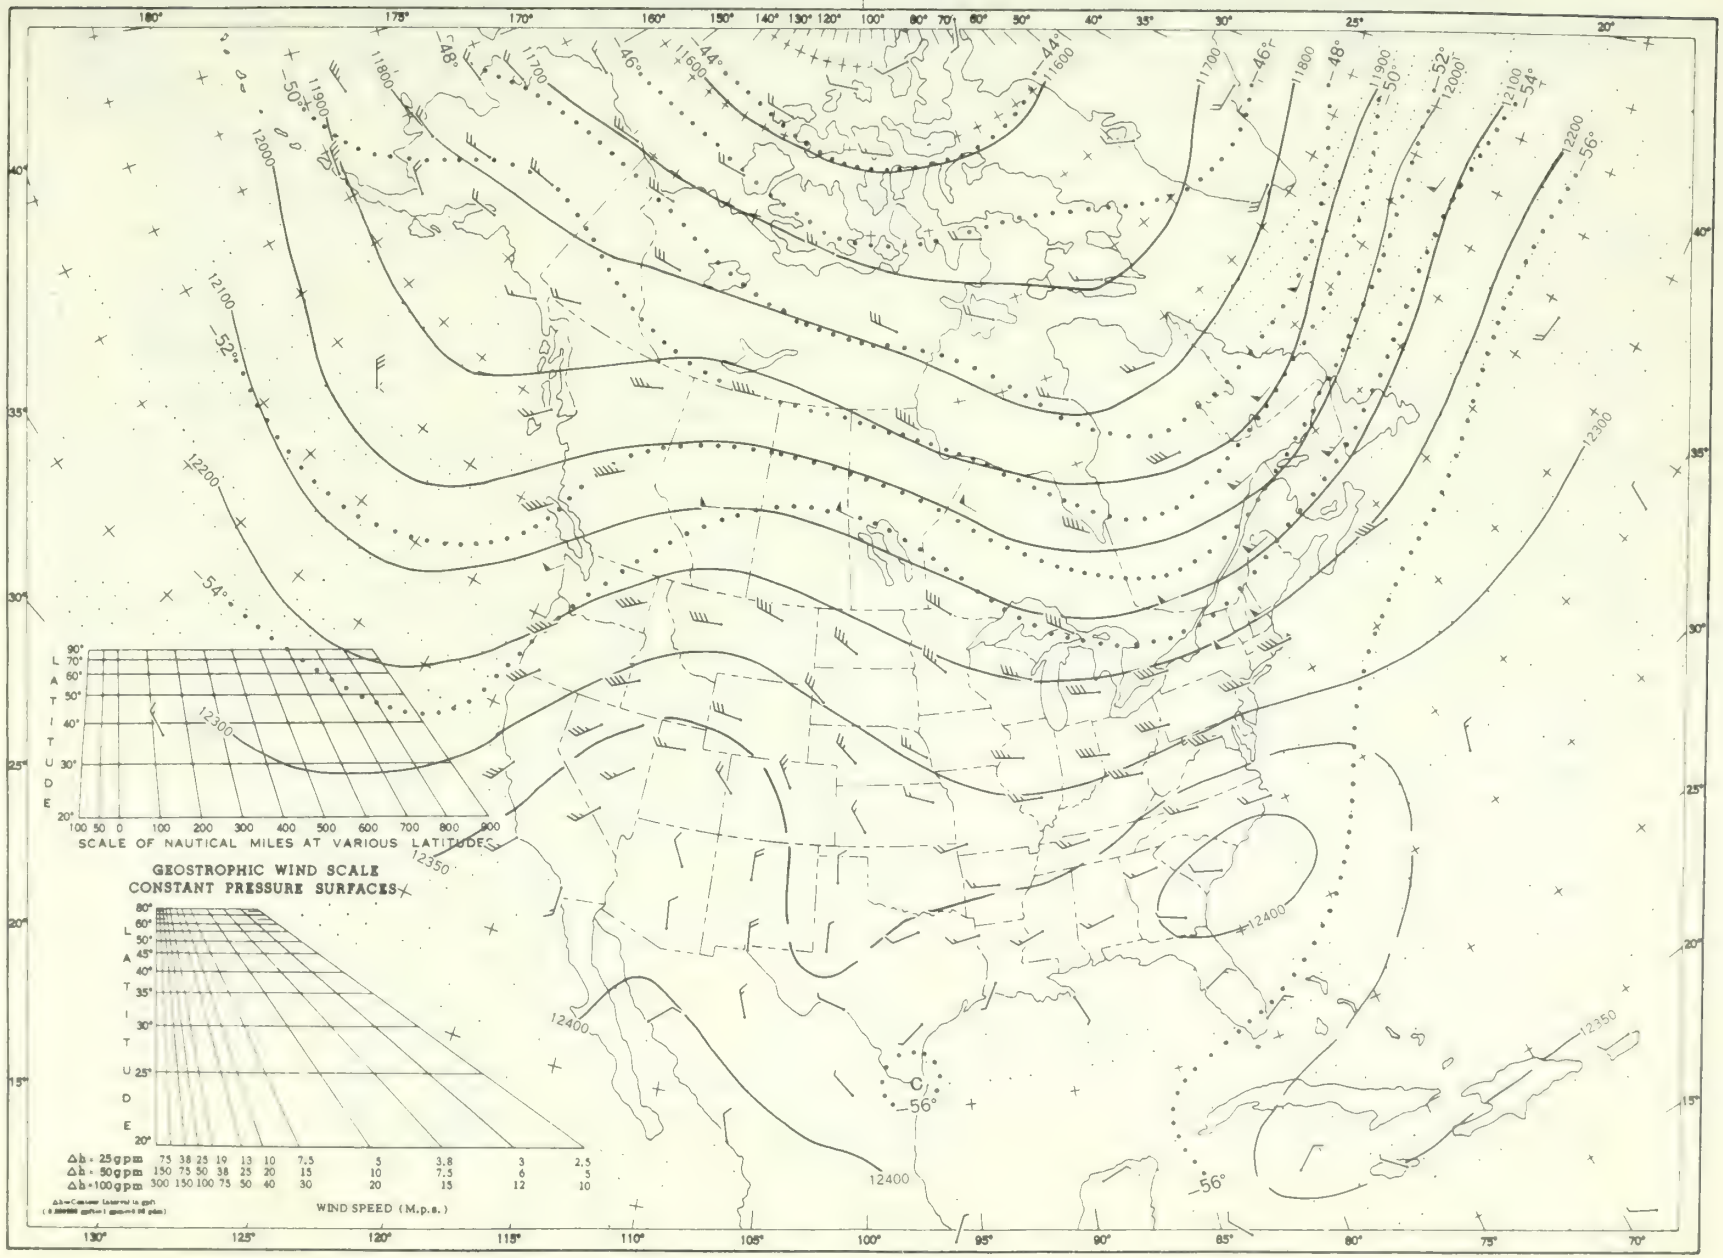
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 G.m.t., August 1971.—Average Height and Temperature, and Resultant Winds



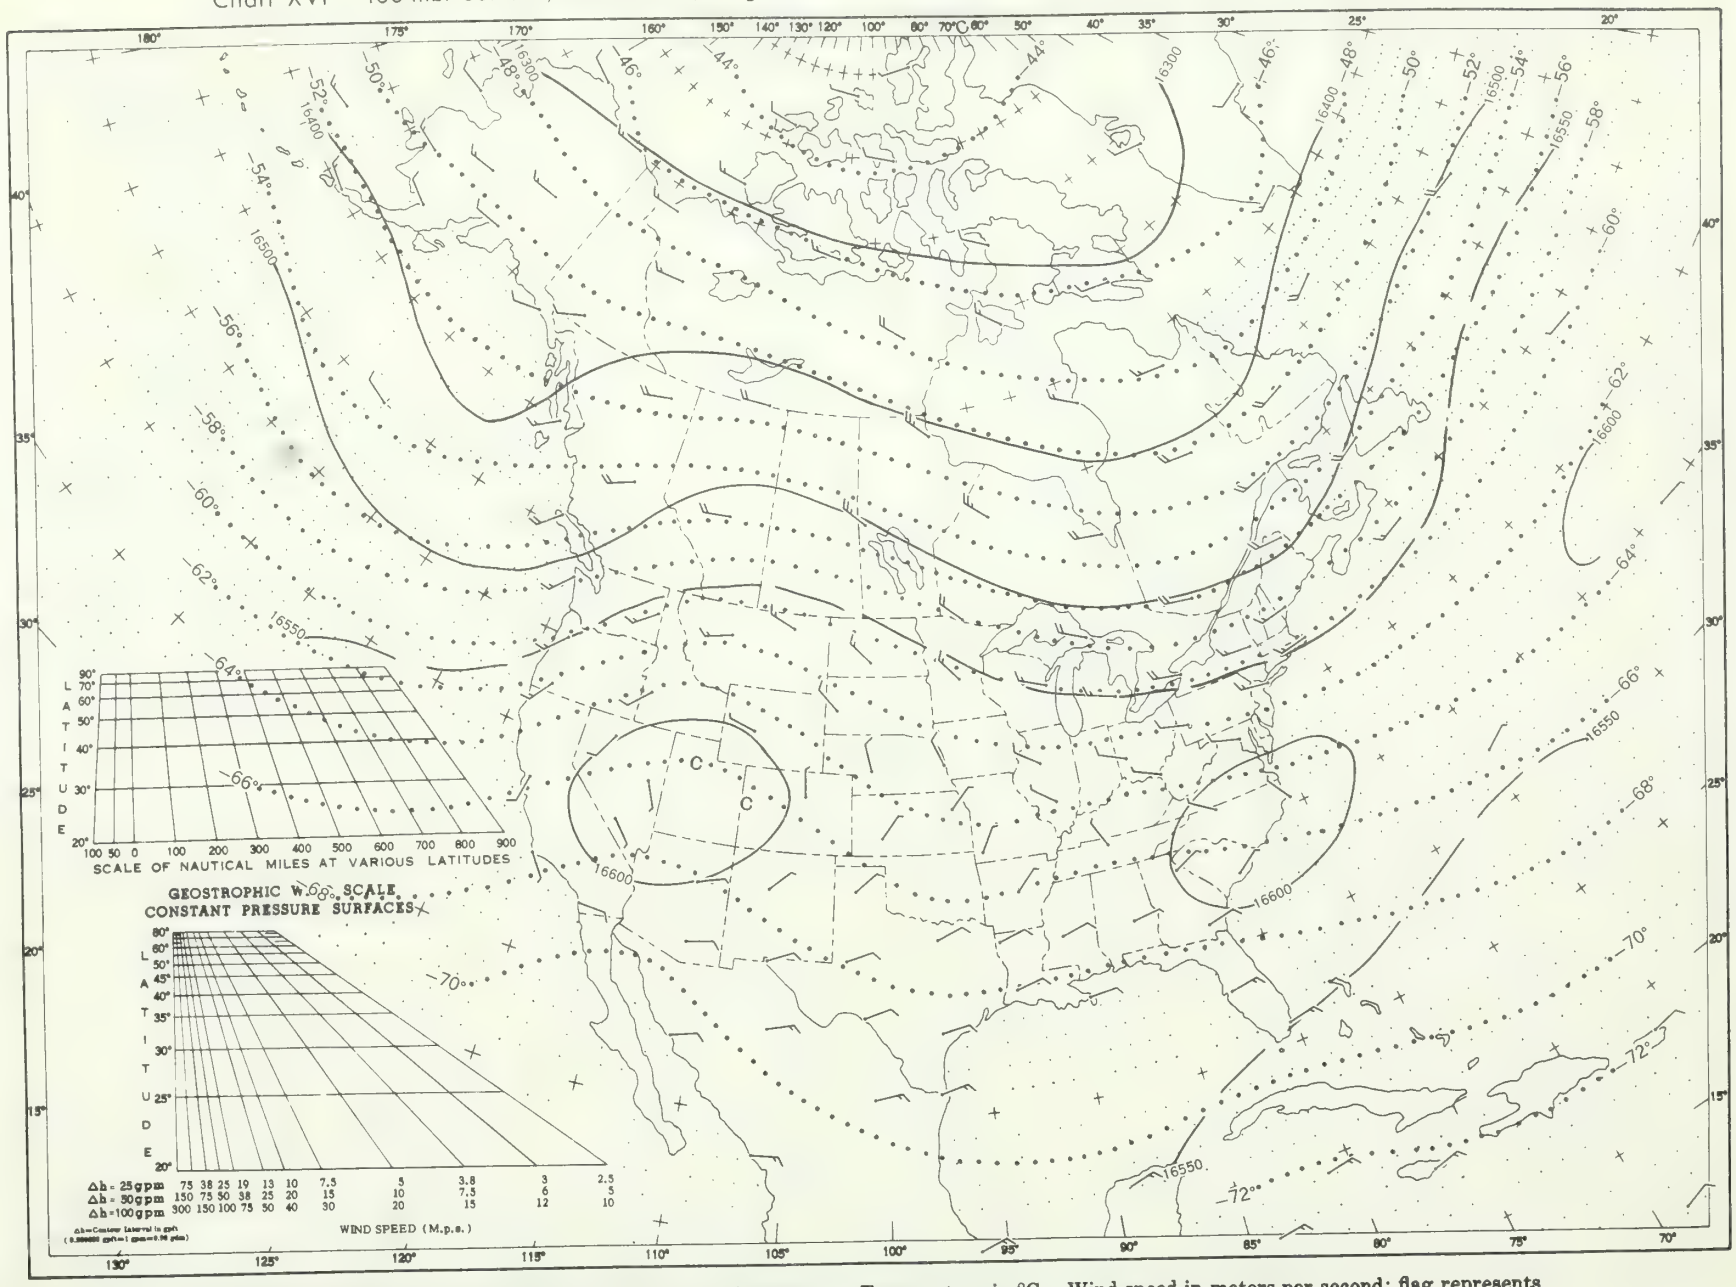
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 G.m.t., August 1971., Average Height and Temperature, and Resultant Winds



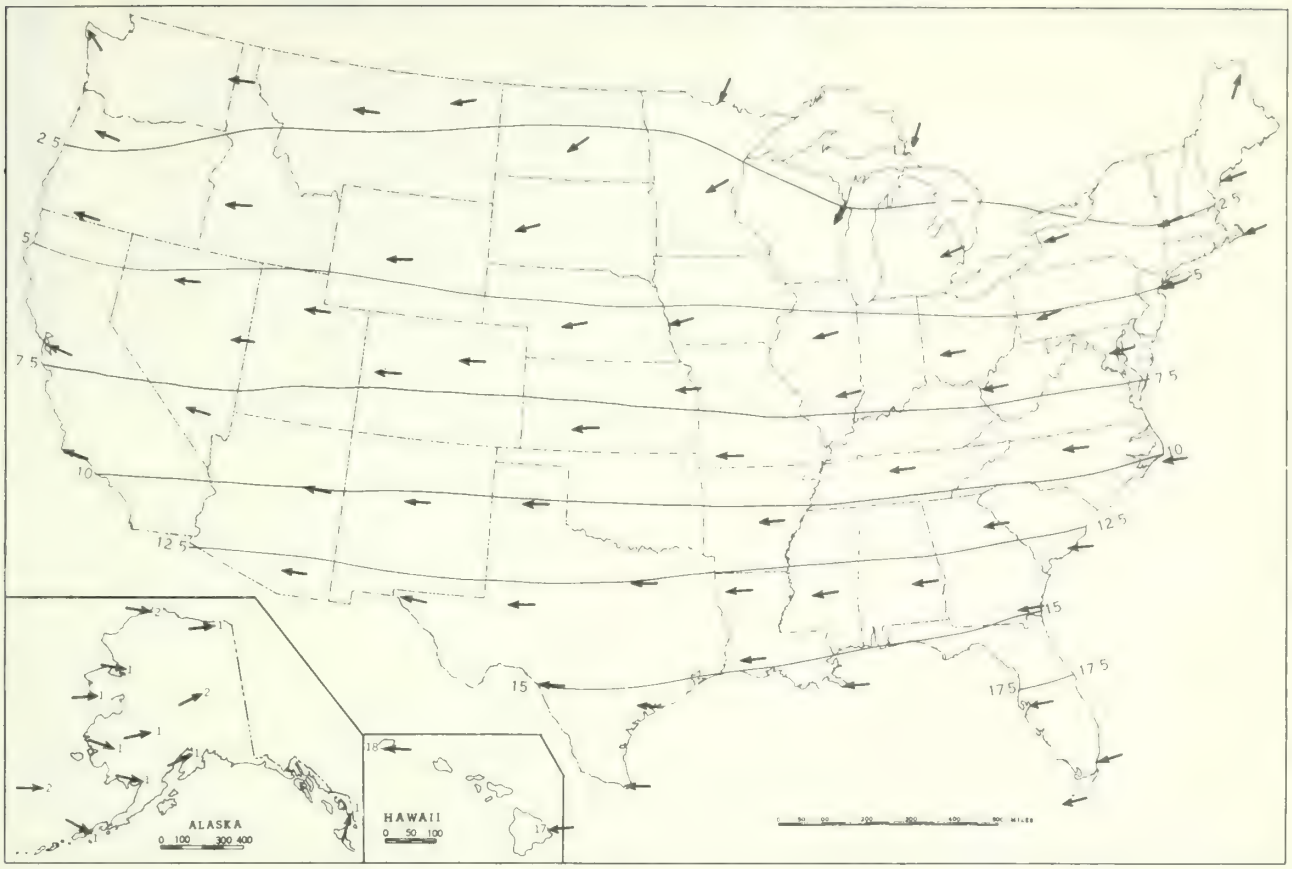
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV 300-mb. Surface, 1200 G.m.t., August 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb Surface, 1200 G.m.t., August 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

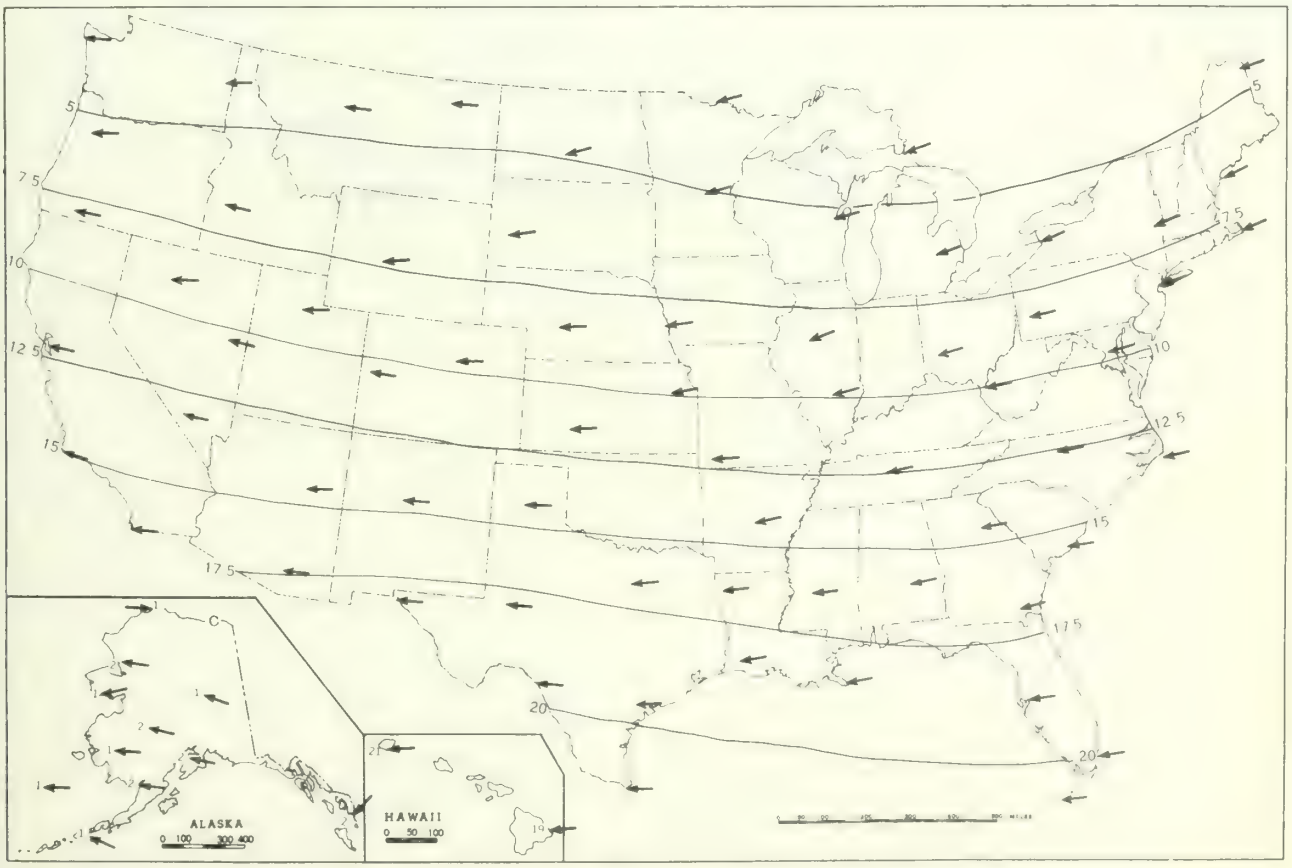


Chart XVI 100-mb. Surface, 1200 G.m.t., August 1971. Average Height and Temperature, and Resultant Winds.

Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

B. 30-mb. Surface, 1200 G.m.t., August 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

SEPTEMBER 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. September was, in general, cooler than normal over the West and warmer than normal over the East.
2. Early heavy snowstorms occurred in the central Rocky Mountains shortly after midmonth.

TEMPERATURE--In general, September temperatures averaged below normal over the western half of the Nation and above normal over the eastern half. Monthly temperature departures were usually small. Few stations averaged more than 4° cooler or 4° warmer than normal.

The Far Northwest was cool and comfortable in the first few days of September. Southerly winds on the back side of a HIGH which lay over the East warmed the Great Plains. On the afternoon of September 2, much of the Dakotas and parts of Nebraska had warmed to 100° or higher, 105° at Pierre, S. Dak. The high eighties and nineties were common elsewhere over the Great Plains on the 2d. With the warming trend came increased humidity which added to the discomfort of the citizens over the eastern half of the Nation. The Southwest was hotter but less humid. Temperatures in the desert regions of the Southwest approached or exceeded 100° on most afternoons in the first half of September. Palm Springs, Calif., registered 120° on the afternoon of September 12.

Cool air poured southward over the Rocky Mountains and Great Plains early in the second week of September. Denver, Colo., was 20° cooler on the 8th than on September 7. Pickstown, S. Dak., registered 99° on the 7th but no higher than 66° on the 8th. A warming trend occurred over mid-America about midmonth followed by sharp cooling. Maximum temperatures at Valentine, Nebr., on the 13th and 14th were 95° and 65°, respectively. Subfreezing weather covered the high Rocky Mountains on the morning of September 16 when Alamosa, Colo., registered 27°. The Deep South continued hot and humid until a cold blast lowered maximum temperatures sharply on the 16th. Jackson, Miss., warmed to only 72° on the 16th in contrast to 89° the previous afternoon. A large HIGH centered over the northern Great Plains brought the coldest weather of the season to much of the Great Plains and the central Rocky Mountains. The warmest temperature at Fraser, Colo., on the 17th was 29° and on the morning of the 19th the temperature at Leadville tumbled to 9°.

A High centered over the southern Great Plains brought the coolest weather of record for so early in the season to spots in Arizona, New Mexico, Oklahoma, and western Texas near the end of the third week of September. The Pacific Coast States were cool and comfortable in the fourth week of September. The Far Southwest continued hot. Cool weather prevailed from the northern Great Plains to New England. Clouds held maximums in the eighties across the Deep South except in Florida where there was lots of warm sunshine. In general, the last few days of September were seasonally cool over the West and warm over the East. Autumn chill penetrated far southward into Arizona and New Mexico on the 26th.

In contrast, a large LOW brought sultry summer weather to the Great Plains in the closing days of September. Madison and Milwaukee, Wis., registered 88° on the last day of the month.

PRECIPITATION -- Thinly scattered light thundershowers occurred over much of the eastern half of the United States on September 1. An afternoon shower dropped 2.28 inches of rain at Vandalia, Ill. About the middle of the first week of September, light rain showers fell along a slow-moving cold front that stretched from the northern Great Plains southwestward across the central Rocky Mountains. A few snow flurries occurred in the mountains. As the front moved further south, it set off thunderstorms some of which were accompanied by hail and strong winds. Hobart, Okla., received 4.75 inches of rain on the afternoon of September 4. A depression off the Louisiana coast spread showers from Texas to Florida, with some totals exceeding 5 inches. A few storm totals in the Dakotas also exceeded 5 inches. California and western Texas continued dry. Five tropical cyclones entered the weather picture in the second week of September. Hurricane Edith swept across the Caribbean Sea and lashed Nicaragua and Honduras before slamming into the Louisiana coast accompanied by heavy rains and a few tornadoes. Hurricane Fern drifted inland near Port O'Connor, Tex., producing heavy rains and widespread flooding. She dumped up to 26 inches of rain in the Coastal Bend area of Texas, causing some of the worst flooding since Hurricane Beulah struck the Lower Coast in September 1967. Two deaths and property damage exceeding $30 million were attributed to Hurricane Fern. Hurricane Ginger dallied over the Atlantic Ocean for almost 3 weeks before moving inland across the North Carolina coast on the 30th, producing generous rains in parts of Virginia and North Carolina. Tropical Storm Heidi threatened the Atlantic seaboard on September 12. Hurricane Irene crossed Central America to the Pacific Ocean and was renamed Olivia. Tropical Storm Olivia off the coast of Baja California moved northeastward bringing generous showers to the arid Southwest, especially Arizona and New Mexico.

Snow fell in the Great Basin and the northern and central Rocky Mountains and cold rain accompanied by blustery winds fell over the northern and central Great Plains in the latter half of the month.

Snow whitened most of Colorado from September 16 to 20. The heavy, wet snow, ranging from 6 inches to 2 or 3 feet in depth caused extensive damage to trees and utility lines along the eastern slopes of the Rocky Mountains and the adjacent plains. On the afternoon and evening of September 30, a heavy snowstorm, the earliest of record, swept across northern Utah Wasatch Front Counties. Two to 8 inches fell in the valleys; more in the mountains. The heavy, wet snow broke limbs of shade and fruit trees and broke power and communication lines.

Monthly totals ranged from 2 to more than 5 inches

in western Washington and northwestern Oregon. Most other areas west of the Rocky Mountains received less than 1 inch of rain in September. September totals ranged widely east of the Rocky Mountains, from less than 1 inch to more than 16 inches. Most monthly amounts were between 2 and 8 inches.

For the Nation as a whole, most areas received between 50 and 150 percent of normal.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1 C. or above for Alaskan Stations.
Y Peak Gust
; And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

HURRICANE EDITH — SEPTEMBER 5 - 17, 1971

Dick De Angelis
Marine Services
Environmental Data Service

From the depths of the Tropics came one of the season's most potent hurricanes. Developing farther south than most September storms, Hurricane Edith made landfall three times during her lifetime. Nicaragua and Honduras felt her blow first and worst. Then British Honduras and the Yucatan Peninsula were stung. Finally, Edith swept ashore for the last time in Louisiana.

The powerful storm gave first indications of life near 11.5°N., 57.0°W., on the 5th. It was at the time that an exploratory reconnaissance team found a closed circulation. The normal stillness of a tropical evening on Grenada, and other islands in the southern Windwards, was shattered by torrential downpours riding 30-kt. winds. The following day, coastal residents of Venezuela saw cloudiness and felt rain associated with the depression as it skimmed westward across the southern Caribbean. Edith became a tropical storm and was christened on the 7th. Less than 24 hours later, some 150 miles north of Barranquilla, Colombia, pressure fell to 993 mb., winds reached 75 m.p.h., and Edith became a hurricane. The real fireworks came on the 9th as the storm moved predictably west-northwestward toward Nicaragua. It was on this day that Edith explosively intensified to a great hurricane (central pressure less than 950 mb. for at least 24 hours). Her central pressure plummeted to 943 mb. (27.85 inches). Her winds spiraled to an estimated 160 m.p.h. She was described by reconnaissance crews as extremely turbulent. With a small, perfectly formed eye, just 5 miles in diameter, Edith was likened to a giant tornado.

Around midday on the 9th, Cape Gracias, Nicaragua, felt the awesome power of this super storm. A decade had elapsed since this region had known the fury a hurricane could bring. Edith made her way across Honduras. As she took her toll, the land took its toll and when Edith entered the Gulf of Honduras, early on the 10th, she was weak. A 1-day journey across the Gulf brought a minimal hurricane to the shores of British Honduras near Belize. Coastal winds surged to 55 to 60 m.p.h. on some keys, but as Edith moved ashore, her strength dwindled rapidly. She made an uneventful trip across Mexico's Yucatan Peninsula and limped into the Gulf of Mexico near Campeche on the night of the 11th. The beaten storm headed toward Mexico and showed no signs of change until the 13th. Then the life-restoring powers of the Gulf of Mexico began to take effect and Edith once again started to deepen. However, it looked like the end as the tropical storm headed inland near Soto La Marina, Mexico, but she changed her mind and turned north-northeastward back out to sea. After this moment of indecision, Edith accelerated, intensified, and headed for the Louisiana coast. She regained hurricane status about 100 miles northeast of Brownsville, Tex., on the 15th. Her 978-mb. pressure center crossed the Louisiana coast in Cameron Parish, between Grand Chenier and the Rockefeller Wildlife Refuge at about 0800 c.s.t. on the 16th. Edith moved rapidly across south, central, and eastern Louisiana during the next 6 hours; the eye passed near Lafayette at about 1000 c.s.t., 12 to 15 miles northwest of Baton Rouge shortly after noon, and into southern Mississippi near McComb by early afternoon.

The storm slowed and weakened as she moved through Mississippi and across central Alabama on the 17th. By the next morning, she gave out over northern Georgia.

Edith was responsible for widespread damage in a remote and sparsely populated area of Nicaragua. In this area, at least 28 persons lost their lives and 1,876 were left homeless. Poor roads and flooding isolated many of the villages. Food and relief supplies were flown in by United States helicopters and aircraft, in addition to the Nicaraguan effort.

The Texas coast felt the fringe effects of Hurricane Edith as she moved through the Gulf of Mexico toward Louisiana. She generated tides up to 6 feet above normal in the Sabine Pass area and buffeted Freeport and Port Arthur with sustained 40 m.p.h. winds. Gusts reached 53 m.p.h. at Galveston and pressure dropped to 29.53 inches at Brownsville. Rainfall was heaviest at Sabine Pass where 3.50 inches fell. Total damage in Texas was estimated at $180,000, of which $105,000 was to properties and $75,000 was to crops. Most property damage was in the Port Arthur area. Winter vegetables and rice, mainly in Cameron and Jefferson Counties, suffered from the rains.

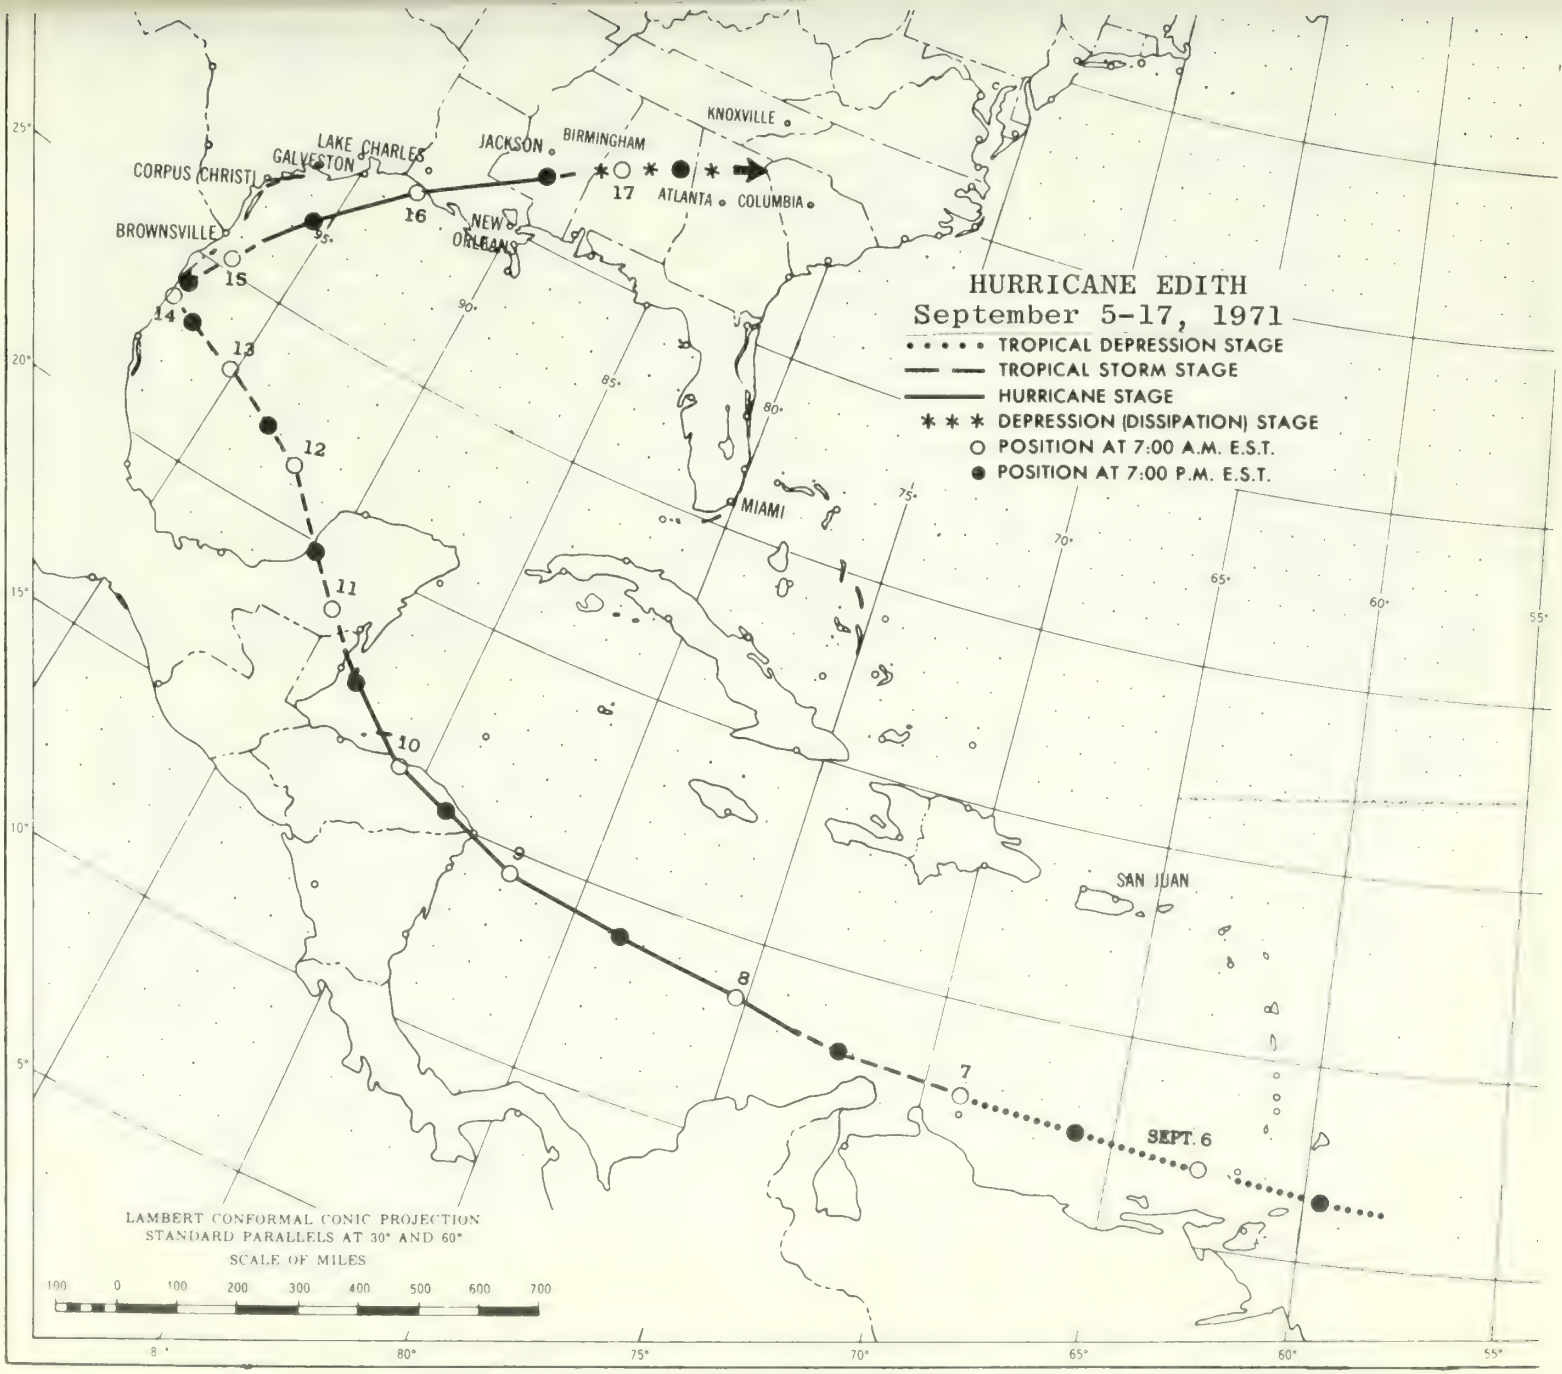
As Hurricane Edith moved toward Louisiana on the night of the 15th, winds and tides increased. Highest sustained winds measured onshore were 69 m.p.h., with gusts to 96 m.p.h. at Cameron. The lowest reported pressure was 29.11 inches in Lafayette. Storm rainfall, accumulating over a 2-day period, ranged from near 2 inches over extreme southeast Louisiana to 6 to 8 inches near and to the north of Edith's track from the west Louisiana coast, northeastward to West Feliciana Parish. Two-inch totals were also common in sections of southwest, central, and northeast Louisiana which were on the fringe of the storm.

The fast forward movement of Edith as she approached the coast caused only a moderate buildup of Gulf waters in the low-lying coastal area. Tides ranged from near 5 feet to more than 8 feet m.s.l. Highest storm tides were reported in Vermilion and Cote Blanche Bays.

As the one strong hurricane rainband swept across southern Louisiana, during the morning of the 16th, several tornadoes were reported. One moved along an intermittent 7-mile path through eastern sections of Baton Rouge, damaging two schools, a shopping center, and some residences.

Edith's damages were mostly light to moderate throughout southern Louisiana. Trees were uprooted, windows broken, billboards toppled, and mobile homes damaged. In many areas, wind and rain did considerable damage to crops. The greatest losses were to sugarcane, soybeans, rice, cotton, pecans, sweet potatoes, and other vegetables. The Louisiana Wildlife and Fisheries Commission reported damage to levees, roads, and water control structures on the Rockefeller and Marsh Island Wildlife Refuges.

In Mississippi, maximum sustained winds along the coast and in the southeast were 45 m.p.h., with gusts to 70 m.p.h. Storm rainfall was heaviest in the southwest where amounts of 5 inches to more than 6 inches were recorded. Most of this resulted from an area of heavy thunderstorms in the Liberty-Breckhaven area during the morning of the 16th. Tides along the coast were 2 to 4 feet above normal. Wind damage was light, but there was some property and crop damage in areas of heavy rainfall. Minor wind damage and power outages were reported in southern Mississippi, and some storm traces were found as far north as Starkville, where 40 m.p.h. wind gusts filled city streets with branches and leaves. In northern Pike County, a number of small bridges were washed out by flash flooding. In Walthall County, power outages and fallen timber



were the main problems. Minor wind damage was reportedly caused by thunderstorms, north of Gulfport. Several tornadoes were reported. One substantiated tornado was seen at about 1000 c.s.t. in Attala County. A motorist saw a small funnel dip down about 1 mile northeast of Ethel. The ropelike funnel caused intermittent damage along a 600-foot path about 25 to 50 feet wide.

Rain fell on Alabama Thursday night and Friday. Totals ranged from 1 to 3 inches with heaviest amounts in the central and southern parts of the State. Except for southeastern and extreme northwestern Georgia, rainfall was 2 inches or more over the State. There were 4-inch totals over Wilkinson, Washington, Johnson, and Laurens Counties in central Georgia and over the west-central counties of Muscogee, Chattahoochee, and Stewart. Rain began on the morning of the 16th in the west, and ended early on the 19th in the east. While there was some overflow of small streams, there was no flash flooding and only minor damage.

HURRICANE EDITH

HURRICANE FERN — SEPTEMBER 3 - 13, 1971

Dick De Angelis
Marine Services
Environmental Data Service

Hurricane Fern was probably spawned by a tropical wave that had moved out of the Caribbean in the beginning of the month. Early on the 3d, a tropical depression was located in the Gulf of Mexico near 27.5° N., 87.5° W. This depression moved slowly northwestward to north of Lake Ponchartrain by the morning of the 5th. At this point, the system turned southwestward. The depression drenched the New Orleans area with 6- to 7-inch rains. Once back over the warm Gulf waters, the depression began to intensify. Fern reached tropical storm strength late on the 7th as her central pressure dropped to 1000 mb. near 27.0° N., 92.5° W. The intensifying storm then began to turn and, on the following day, was heading toward the northwest and was generating hurricane-force winds near her center. Fern's central pressure was down to 987 mb. as she became a hurricane. Gale-force winds were already raking the coast from Galveston to Freeport on the night of the 9th, with Fern's center still 100 miles to the southwest. As the hurricane approached the Texas coast during the daylight on the 10th, she began to swing toward the southwest. Her central pressure dropped to its lowest point - 979 mb. (28.91 inches) - at 0600 c.s.t. on the 10th. Then part of the eye passed over Freeport. It moved past Port O'Connor, near Seadrift, and was over Matagorda Island by about 1100 c.s.t. The eye continued to hug the coastline until it neared Rockport, where it slowed and began to drift inland. At about 1300 c.s.t., the eye was southeast of Austwell. By 1500, it was east of Bayside. The now tropical storm hesitated for a few hours, and then around 1910 c.s.t. the eye moved into Aransas Pass. At 2030 c.s.t. Aransas Pass recorded a 981.4 mb. pressure. The lowest reported pressure by a land station was a 979.34 mb. reading at Ingleside. About 2-1/2 hours after eye passage Aransas Pass was belted with an east wind of 55 m.p.h. with gusts to 78 m.p.h. Indications are that the storm accelerated and by early morning was just south of Hebbronville. Later, the tropical storm crossed the Mexican border near Zapata. On the 13th, she finally broke up in the mountains north of Monterrey.

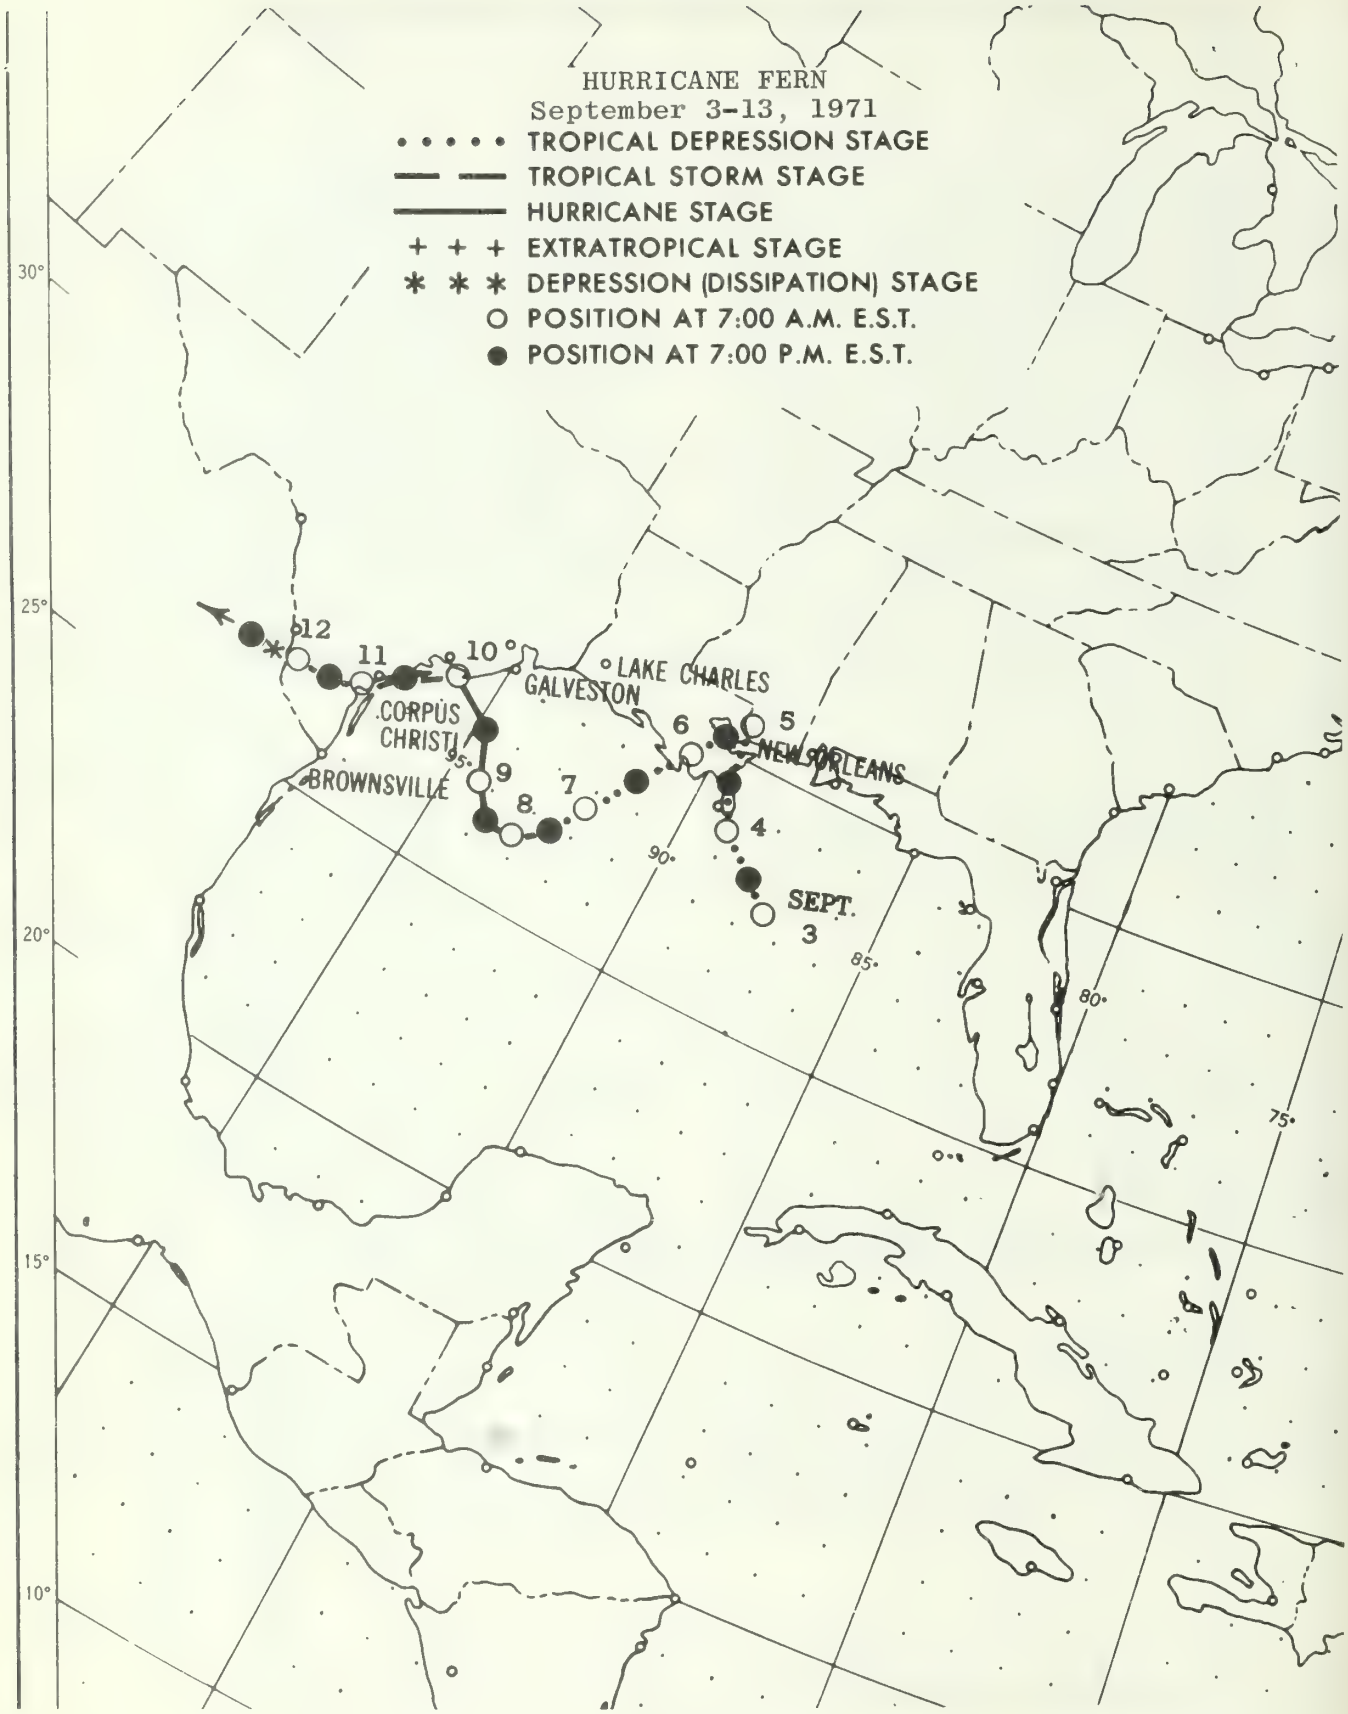
Hurricane Fern produced only moderate tides and winds, but her heavy rainfall was responsible for destructive floods. Maximum sustained winds of 66 m.p.h. were recorded at Corpus Christi. Sustained winds ranged up to 85 m.p.h. at Port O'Connor, where a wind gage was blown away when gusts reached 100 m.p.h. Gale-force winds were experienced from just north of Galveston to near Brownsville. Gusts of 60 m.p.h. or more were reported from Galveston to south of Corpus Christi. Tides from Port Arthur to Brownsville ran 2-6 feet above mean sea level with 5- to 6-foot levels confined to the Galveston-Freeport area. A tide 6 feet above m.s.l. was observed at the U.S. Coast Guard Station at Freeport at 0800 c.s.t. on the 10th.

Fern produced heavy rains in an area north and west of Corpus Christi. Downpours from 15 to 26 inches soaked Bee, Refugio, and San Patricio Counties. Highest totals were 26.0 inches 2 miles south-southeast of Beeville, 25.8 inches 3 miles north of Skidmore, and 21.5 inches at Papalote. Totals of 10 to 15 inches fell over Calhoun, Aransas, Matagorda, Goliad, and Dural Counties. Along the coast from Galveston to Rockport, rainfall amounts increased from 5 inches up to 12 inches. Five-inch totals extended inland as far as Houston. Amounts dwindled rapidly to 1.07 inches near Port Arthur in the north and to a paltry 0.02 inch at Brownsville. Fern was still potent as she made her way into Mexico. Laredo, some 75 miles north of the center, recorded 8.28 inches.

While dumping 10 to 26 inches of rain on the Coastal Bend area, Fern caused the worst flooding in south Texas since Hurricane Beulah in September 1967. Numerous towns were isolated, and many were flooded. The heavy rainfall sent floodwaters crashing over Wesley Seale Dam at Lake Corpus Christi, causing major flooding along the lower Nueces River. Considerable flooding also occurred on the Frio, Lavaca, Navidad, San Antonio, Guadalupe, Mission, and Aransas Rivers. Water inundated most sections of Robstown where a levee broke in two places. Water was 2 to 3 feet deep in some houses at Sinton. Some rural areas suffered the worst flooding of this century. In the Alice area, creeks reportedly rose to about the same height as during Beulah, but rose more rapidly and consequently caused more damage.

Five small tornadoes were observed during Hurricane Fern. Two tornadoes occurred at Texas City on the 10th, one near Riveria and Falfurrias on the 11th, and one near Orange Grove on the 12th. Total tornado damage was estimated at $17,000. There were no injuries. Six funnel clouds aloft were observed.

Because of flooding, both property and crop damage was greatest in San Patricio County. Wind damage was minimal except in Calhoun and Aransas Counties. Fortunately, most coastal area crops had been harvested prior to Fern's arrival; thus, agricultural losses were minimal - totalling $5,060,000 for the storm-affected area. While there was some permanent damage to fall and winter vegetables, and some reduction in yields and quality of cotton, sorghum, peanuts, and soybeans, the second cutting of the rice harvest was the most seriously affected by the heavy rains.



The property damage in Texas was estimated at $25.17 million, making the total storm damage $30.23 million.

Hurricane Fern was directly responsible for only two deaths in Texas. One swimmer drowned at the Corpus Christi City Marina on the 11th, and another person drowned near Refugio on the 12th.

HURRICANE GINGER — SEPTEMBER 5 TO OCTOBER 5, 1971

Dick De Angelis
Marine Services
Environmental Data Service

At midday on September 10, the National Hurricane Center proclaimed that Tropical Storm Ginger had been born, some 275 miles south of Bermuda. At midday on October 5, a bulletin was issued that Ginger was dying some 420 miles northwest of that same island. These reports marked the beginning and the end of the longest-lived hurricane to ever roam the North Atlantic Ocean. It was probably the world's longest-lived tropical cyclone. For almost the entire month of September and into October, Ginger owned a large piece of the North Atlantic, threatening any trespassing ships with hurricane-force winds and dangerous seas.

Ginger, detected as a depression on the 5th near 25.5° N., 71.5° W., wound up slowly, and it wasn't until 1200 on the 10th that she reached tropical storm strength. However, the next day near 27.9° N., 63.3° W., Ginger was a hurricane. Her well-defined eye had a 991 mb. pressure at this time. She continued on an east-northeastward heading at about a 10 m.p.h. speed. On the 12th, the ship ADONIS was whipped by 58 m.p.h. winds some 120 miles south of the storm's center. Winds near the center were about 85 m.p.h. On the 13th, Ginger continued to grow and intensify as her 959 mb. center turned eastward. This was the lowest pressure in Ginger's long life. Maximum sustained winds were up to 104 m.p.h. Suddenly, Ginger slowed and reversed her field. By the 14th, she was moving westward. While her intensity abated somewhat, Ginger remained big and strong as she meandered westward. On the 16th, 52 m.p.h. winds lashed the ATHELDUKE some 90 miles north of Ginger's center and the DALILA some 100 miles to the west.

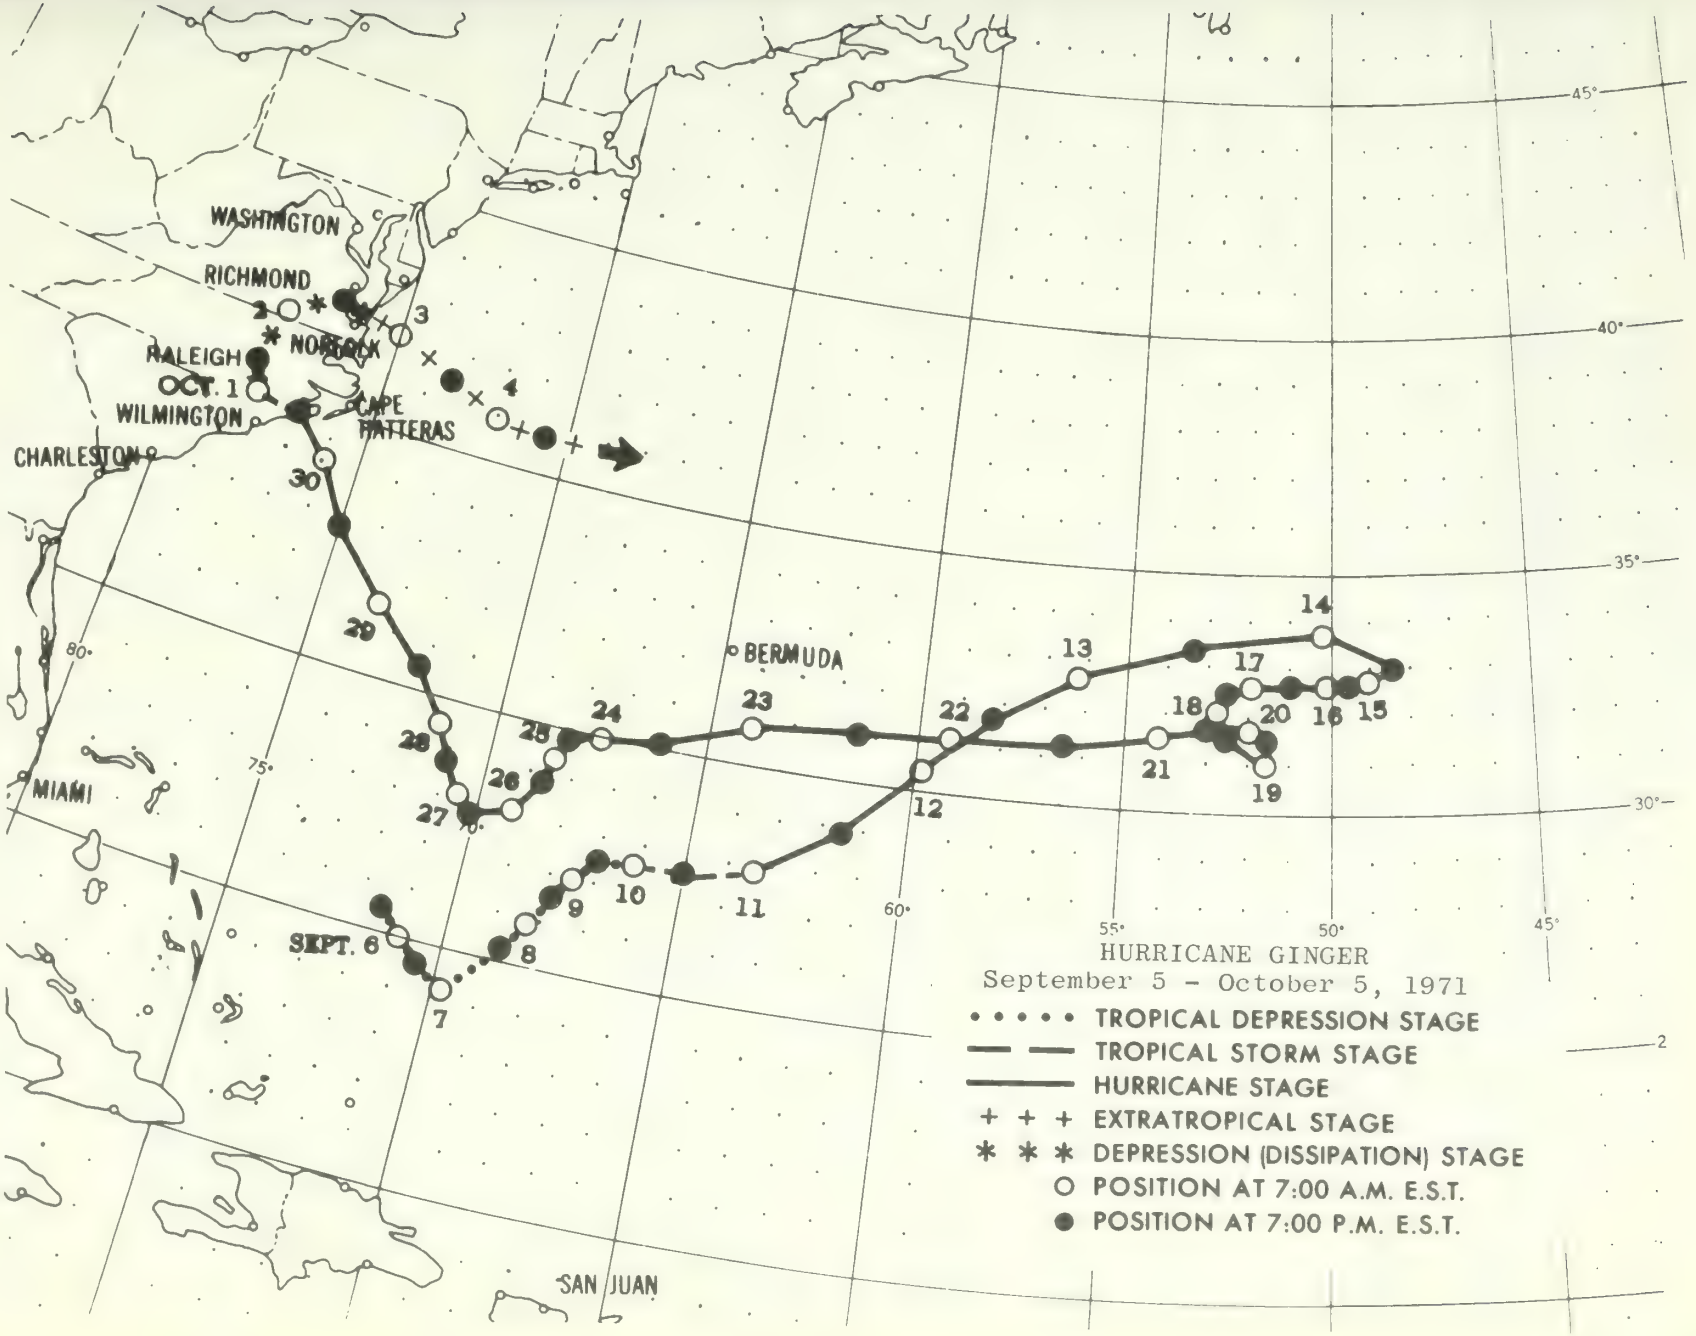
Ginger's central pressure continued to rise on the 17th and 18th, as she turned southeastward. On the 19th and 20th, she completed a counterclockwise loop near 32° N., 52° W. After these acrobatics, the hurricane began a definite westward trek. On the 22d, Ginger crossed her path of 10 days before. At this time, her rising central pressure topped out at 995 mb., and Ginger was a large loosely organized storm with gales out to 200 miles. On the night of the 22d, gales and heavy surf began to pound Bermuda. Early the next day, Ginger slipped by Bermuda about 100 miles to the south. Bermuda experienced gale-force winds in gusts for 17 hours because of the large size and slow movement of the storm. Highest winds reported were 35 m.p.h. with gusts to 70 m.p.h. at Kindley Naval Air Station. Ginger's large circulation was also creating heavy surf along the north coast of Puerto Rico, Hispaniola, the Bahamas, and along the southeast coast of the United States.

Ginger slowed again and turned southward by the night of the 24th. At the same time, her central pressure began to fall. On the 25th, the BORNHEIM battled 58 m.p.h. winds, 150 miles northwest of the deepening pressure center. Winds rose to 85 m.p.h. near the center as swells continued to fan out and pound distant coastal areas. On the 26th and 27th, the ORE-SATURN and URSHALIM both within 60 miles of Ginger's eye encountered 60 to 70 m.p.h. winds. During this period the storm underwent another change in direction as she swung around toward the northwest. On the afternoon of the 27th, Ginger's central pressure dropped to a secondary minimum of 969 mb. Maximum sustained winds were near 100 m.p.h.

Ginger accelerated on the 29th, but then slowed the following day as she approached the North Carolina coast. She came ashore near Morehead City late on the 30th. This was close to where Tropical Storm Doria had moved inland just 1 month before. Once inland, the large storm weakened rapidly. It was just a dissipating depression by October 1. On the 2d, the weakening storm moved northward into southern Virginia, then turned eastward, and moved back out into the North Atlantic near the mouth of the Chesapeake Bay. Early on the 5th, the remnants of Ginger were last seen at 36° N., 70° W., heading east-southeastward.

As Ginger moved toward the North Carolina coast, wind gusts up to 92 m.p.h. were reported at Atlantic Beach. Gusts from 40 to 75 m.p.h. were common along the Outer Banks and the shores of Pamlico Sound. Maximum sustained winds were less than 50 m.p.h. over eastern North Carolina and southern Virginia. Ocean tides ran 2 to 4 feet above normal from Norfolk to Morehead City. Tides on Pamlico Sound and its estuaries ran 4 to 7 feet above normal. At Washington, Aurora, New Bern, and Cherry Point, tides were all 6 feet or more above normal.

Rain was heaviest along the shores of the Pamlico Sound, where 10 to 13 inches doused several east-central North Carolina counties. It was here that crops suffered heavily. Thousands of acres of corn and soybeans were seriously affected with preliminary damage estimates placed at $10 million. This was the greatest economic impact of any hurricane on North Carolina since Donna in September of 1960. Rainfall totals of greater than 10 inches were reported at Bayboro, Belhaven, Aurora, and on Roanoke Island. Property damage was minor in most areas. In areas of flooding it was termed light to moderate.



Rainfall was moderate in southern Virginia. Norfolk reported a storm total of 7.61 inches between September 30 and October 3. Totals throughout the southeastern part of the State generally exceeded 2 inches and many exceeded 5 inches. Along the Maryland-Delaware Eastern Shore, rainfall totals of 0.5 to 2 inches were common. A maximum sustained wind of 28 m.p.h. was reported at Indian River Coast Guard Station.

No deaths or injuries were reported anywhere, and there were no tornadoes associated with Ginger.

° Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS SEPTEMBER 1971

Elmer R. Nelson, Office of Hydrology

The most destructive flooding during September occurred in New Jersey and southeastern Pennsylvania. This was the second consecutive month that the most damaging floods in the nation occurred in this area. The total damages during September were estimated from $80 million to $100 million with 14 deaths.

The second most damaging flood during September occurred in southern Texas from the heavy rains accompanying Hurricane Fern. The total damages in the lower Nueces Basin and the coastal plains of Texas were estimated at $21.5 million with one death.

ATLANTIC SLOPE DRAINAGE

Heavy rains between the 11th and 14th caused minor stream overflows in western Connecticut. The rainfall totalled near 7 inches in western Connecticut with sharply reduced amounts north and eastward through New England. Damages were reported from extensive street and road flooding due to clogged sewers and insufficient capacity culverts. Underpasses and cellars were also subjected to flooding in areas of heavy downpours.

Heavy intermittent precipitation from the 11th through the 15th in southeastern Pennsylvania and central and northeastern New Jersey caused record flooding on some small creeks. Precipitation was especially heavy on the 13th when over 12 inches of rain was recorded in extreme southeastern Pennsylvania. Record flooding occurred on Wissahickon, Cobbs, and Chester Creeks in the Philadelphia, Pa., area. A 40-year record on Chester Creek was broken when the record gage height of 16.21 feet of June 25, 1950, was exceeded on the 13th by nearly 8 feet when it reached a height of about 24 feet. In North Jersey, the Pascack Brook at Westwood and Saddle River at Lodi reported record gage heights. Two separate areas recorded heavy damage due to the flooding on the 11th-14th. The Philadelphia, Chester, Delaware, Bucks, and Montgomery Counties of southeastern Pennsylvania and Bergen, Passaic, Essex, and Union Counties of northeastern New Jersey reported heavy damages and record stages. Damage estimates by Civil Defense officials range from $80 million to $100 million for both private and public sectors. These counties were declared a disaster area. In New Jersey, the disaster declared for the flood of Aug. 27-28 was extended to include all flood damages through Sept. 14. Eleven deaths were reported in southeastern Pennsylvania and three deaths in New Jersey. Around 3,000 families were evacuated in southeastern Pennsylvania and 700 families in northeastern New Jersey.

Reservoir storage in New Jersey increased again in September due to above normal rainfall. In the 13 principal reservoirs of New Jersey storage increased by about 2 billion gallons during the month. Several reservoirs were at capacity or spilling at the end of September. New York City's three reservoirs on the upper Delaware remained at about 62 percent of usable capacity at the end of September.

Heavy rains on the 30th in advance of Hurricane Ginger in eastern North Carolina caused only minor rises on the last day of September but some bankfull stages and overflow early in October.

Major flash flooding occurred at and upstream from Elkin, N. C. on Elkin River (Big Elkin Creek) in the Yadkin-Pee Dee Basin. Minor flooding occurred along the Yadkin River at and downstream from Elkin, N. C., and along the Broad River at and below Blair, S. C. Minor flooding was observed along the Waccamaw River and the lower reaches of the Edisto River in South Carolina and the Lumber River in North Carolina. Losses occurred mainly on tributaries and small streams of the Yadkin River in and near Elkin, N. C. The total losses were estimated at $308,000.

EAST GULF OF MEXICO DRAINAGE

Heavy precipitation on the 17th and 18th associated with tropical depression Edith caused moderate rises on the Chattahoochee and slight flooding on tributaries in Georgia. No damage resulted from the slight overflows.

Flash flooding occurred in southern Mississippi from the heavy rains associated with Edith. Low-lying roads and areas of poor drainage were briefly inundated. Little damage resulted from the flash flooding except in Pike County where there was some road damage.

Minor flooding occurred on the lower Pearl River at Monticello, Miss., on the 17th-18th and at Bogalusa, La., on the 19th-23d. Farming and timber cutting operations were delayed by the light flooding. The overflow at Bogalusa, La., hampered work at construction sites adjacent to the river.

MISSISSIPPI SYSTEM

Missouri Basin--River levels in the Missouri Basin remained generally at low flow during September.

Localized excessive rains of 2 to more than 4 inches on the North Fork of the Solomon River in Kansas during the evening of Aug. 31 and early morning of Sept. 1 produced some minor small stream flooding. Rises were well within banks along the main stem of the Solomon River. Damages, if any, were minor.

Ohio Basin--Heavy rain on the 11th-14th produced considerable flooding in the Monongahela Basin in West Virginia and Pennsylvania on the 14th-15th. Four to 5.1 inches of rain during the night of the 13th-14th produced major flooding on the Youghiogheny River and tributaries from Confluence, Pa., to Sutersville, Pa. The runoff was excessive as the soil was already saturated from previous rains. The greatest damage occurred in Connellsville, Pa., where as many as 50 homes were affected. Flooding and a considerable number of evacuations occurred in West Newton and Sutersville, Pa. This was the highest water on the Youghiogheny below Connellsville since the major flood of 1954. A bucket survey showed a storm total of 9.3 inches at Champion, Pa., where major flooding occurred on Indian Creek.

Considerable flash flooding occurred on the mountain streams in Pennsylvania on the 14th. The high water on Dunbar Creek cut a new channel through a part of the city of Dunbar. Fifty homes were affected in Dunbar, Pa., 15 in Dawson, Pa., and 15 in Everson, Pa. Up to 12 bridges were destroyed in Fayette County which was declared a disaster area. The heaviest rains occurred in eastern Fayette County. Heavy rains and flooding occurred in Cambria and Somerset Counties. Other small towns hard hit were Laurelville on Jacobs Creek and Melcroft on Indian Creek. Some 20 homes were flooded by Jacobs Creek in Scottdale, Pa. Other towns affected were Monarch, Markleysburg, Normalville, and Springfield township.

Heavy rains in excess of 3 inches on the 12th-13th produced minor flooding on the Tygart, Cheat, and lower West Fork Rivers in West Virginia. The rains continued for another 48 hours with an additional amount

of 1 to 2-1/2 inches. Little, if any, damage occurred in this area.

Locally heavy rain (4.21 inches) during the night of the 6th-7th caused some flooding of farmland in Roane County around Walton, W. Va. Most of the rain fell on the 6th between 8 p.m. and 11 p.m. Several county roads in Kanawha County were inundated from the heavy rain. Some streets and basements in the Charleston, W. Va., area were also flooded. The county Agricultural Extension agent estimated damage in Roane County at $2,200.

Locally heavy rains on the 12th-13th caused some minor flooding in Ritchie, Wetzel, Nicholas, Roane, Braxton, Clay, and Doddridge Counties in West Virginia. Some highways were flooded in low places. The Clay County agent reported 100 acres of farmland flooded and some wooden bridges washed out.

A flash flood occurred on the 27th on the Little Birch River in the southeastern corner of Braxton County in West Virginia due to locally heavy rain. Some basements and a road were flooded. Damage was minor.

Arkansas Basin--Flash flooding occurred in the Bird Creek Basin in Oklahoma from torrential rains on the 4th-6th and 18th-19th. During the first storm, the precipitation averaged 6 to 8 inches with some unofficial amounts of up to 16 inches reported west and southwest of Tulsa. Precipitation in the Spring River Basin averaged around 3 inches. During the second storm, the precipitation averaged 3 to 4 inches.

Bird Creek reached its highest crest since September 1961 during the first rise. Pole Cat Creek crested about 7 feet above flood stage at Sapulpa, Okla., during the first storm and 2 feet above flood stage during the second storm. Flooding occurred from just below Heyburn Dam to its confluence with the Arkansas River south of Tulsa, Okla. Spring River at Carthage, Mo., crested 3 feet above flood stage on the 6th but remained within banks downstream at Waco, Mo. Damages were extensive in Oklahoma especially at Kiefer, Jenks, Sperry, and northeastern Tulsa. Houses were flooded, roads and bridges washed out, crops damaged, livestock drowned, and farm machinery and fences damaged. Three people lost their lives. Flood damages for the city of Tulsa and surrounding counties were estimated in excess of $2 million. Little or no significant damage resulted from the flooding on Spring River in southwest Missouri.

Heavy rains totalling more than 5 inches during the 24-hour period ending on the morning of the 6th caused minor flooding on the Deep Fork at Begga, Okla., on the 6th-8th. The crest on the 6th was 1.4 feet above flood stage.

Red Basin--Heavy rain during the evening of the 4th caused flooding on the North Fork of the Red River and Headrick, Okla., on the 5th-6th. Five to 7 inches of rain were reported in 2 to 3 hours in the Elk Creek Basin in western Oklahoma. The areas near Hobart and Altus, Okla., experienced flash flooding during the evening of the 5th. The damages were estimated at $60,000.

The Red River at Burkburnett, Tex., rose to near flood stage on the 19th and 26th due to heavy thundershowers. Beaver Creek at Electra, Tex., reached near flood level on the 25th.

WEST GULF OF MEXICO DRAINAGE

Light flooding occurred on the Mermentau Rivers at Mermentau, La., on the 19th-22d and on the Calcasieu River at Hineston, La., on the 21st-22d. These overflows were due to heavy rainfall associated with Hurricane Edith which moved inland on the 16th just east of the Mermentau River. The heaviest rainfall occurred at Mermentau which totalled 8.21 inches during the storm.

Flash flooding occurred in Garland and Mesquite, Tex., during the evening of the 24th. Two inches of rain in a 2-hour period caused the flash flooding.

Locally heavy rains of 4 to 6 inches during the morning of the 24th produced nearly a 5-foot overflow on the San Saba River at San Saba, Tex. Damage was insignificant and was confined to farm roads and low water crossings. A major rise occurred on the Colorado River of Texas on the same date from Winchell, Tex., to Lake Buchanan, but no overflow occurred.

Heavy rainfall, associated with Hurricane Fern, on the 10th-12th caused flooding on the Navidad, Lavaca, and Guadalupe Rivers in Texas. The heaviest rainfall reported during the 3 days was 17.75 inches on the Guadalupe River at Goliad, Tex. Rainfall amounts generally ranged from 4 to 8 inches. Some flooding occurred on the San Antonio River southward to its confluence with the Guadalupe River. No significant damage resulted from the overflows.

Hurricane Fern moved inland on the Texas coast about 70 miles southwest of Galveston about 6 a.m. on the 10th with minimal hurricane force winds dominating the weather. Only minor property damage, by hurricane standards, resulted from storm tides as the tropical cyclone moved along the coastline to Corpus Christi with winds 60 to 70 m.p.h. From Corpus Christi the storm turned southwestward to the Rio Grande south of Laredo. Ten to 20 inches of rain fell in the coastal counties northwest of Corpus Christi and near 10 inches south of Laredo, Tex. During the approach of the storm, northwesterly gale winds splashed water from Lake Corpus Christi over Wesley Seale Dam, causing flash flooding along the extreme lower Nueces beginning near midday on the 10th.

Flash flooding occurred throughout the coastal plains from the Nueces River northeastward during the evening and night of the 10th. Drainage flooding and stream flooding along the creeks and small rivers continued to spread southwestward later that night through the 12th. Fields were flooded throughout the area with considerable soil erosion, but crop damage was relatively minor as most harvesting had been completed. Most of the roads in the coastal plains were closed by the high water and most of the towns were isolated at one time or another.

Flooding was extensive in the towns. At Refugio, drainage flooding was added to by water from the Mission River, which reached a stage of 41 feet on the night of the 11th, 2 feet higher than the previous record, and isolated the town for 12 hours. Automobiles were washed off highways in the vicinity, and water was up to 10 feet deep in parts of the town. Sixty to 65 buildings were flooded including 37 homes, and 75 families were evacuated. A traveler seeking to cross the floodwaters from Melon Creek on U. S. Highway 77 north of the town was drowned.

In San Patricio County, the town of Sinton was flooded with water up to 4 feet deep. Fifteen hundred homes sustained major damage, and 2,300 persons were evacuated. Sixty persons were evacuated at Mathis, 100 to 150 at Odem, 20 to 30 at Ingleside, and 75 at Taft. At Taft, 200 homes and 50 businesses were damaged.

In Nueces County, Robstown suffered the most extensive flood in its history. Twenty-two hundred persons were evacuated. At Driscoll, 200 homes and 30 businesses were damaged, the water supply was contaminated, and 200 persons were evacuated. At Bishop,

300 homes and 40 businesses were damaged. About 50 homes and businesses were damaged in each of the towns of Banquete and Agua Dulce.

In Jim Wells County, heavy damage occurred to streets and homes, and in Alice where about 1,200 persons were evacuated.

Drainage flooding was relatively minor in Kleberg and Brooks Counties, but Falfurrias, in Brooks County, sustained heavy stream flooding from several creeks which run through the vicinity and drain large areas of Jim Wells, Duval, Brooks, and Jim Hogg Counties. More than 500 persons were evacuated, and 500 homes and businesses were damaged.

On the extreme lower Nueces River, rainfall runoff added to the flooding which resulted from splashover at Wesley Seale Dam and raised the water level at Calallen to 9 feet, 2 feet above flood stage, by the evening of the 11th. Major Flood Warnings were issued in the morning of the 12th. The river continued to rise, reaching a stage of nearly 14 feet at Calallen in the morning of the 13th, which was second only to the Hurricane Beulah flood of 1967. Many persons were evacuated by helicopter.

Runoff into the middle Nueces, mainly from creeks to the south, but also from the lower Frio, caused flooding to begin on the 12th from above Tilden to Lake Corpus Christi. Flooding became extensive about the 15th, and increasing flow through the lake brought a second rise and extensive flooding on the extreme lower Nueces from about the 19th through the 22d. The river receded below flood stage at all points by the end of the month.

The total damages in the lower Nueces Basin and the coastal plains were estimated at $21.5 million.

GULF OF CALIFORNIA DRAINAGE

Colorado Basin--Flash flooding was reported in portions of southern Arizona on Sept. 1-8 and on Sept. 29-30. Flash flooding occurred at Tucson, Ariz., on the 1st, 2d, 8th, and 29th and at Yuma, Ariz., on the 29th-30th.

Flooding occurred on the Little Colorado River in northeastern Arizona from Sept. 29 to Oct. 1. It crested at Winslow, Ariz., on Sept. 30 to Oct. 1. Damage from the flooding was estimated at $1.4 million.

ALASKA

Tazlione, the lake dammed by Tazlina Glacier in the Copper Valley began releasing its water into Tazlina Lake during the latter part of August. One cabin was flooded from the 6-foot rise in the lake during early September. Due to the advance warning of the breakout by the National Weather Service, food supplies and equipment were removed from the cabin and no damage resulted. The highest water from the outburst of Tazlione crested in the Tazlina River at the Valdez highway bridge on Sept. 4. The U. S. Geological Survey reported that the river rose about 6 feet at the bridge site but did not overflow. No flooding occurred along the Copper River downstream from its confluence with the Tazlina River.

An aerial reconnaissance by the National Weather Service on Sept. 10 revealed that the lake dammed by Skilak Glacier on the Kenai Peninsula was dumping and may threaten residences along the lake and the Kenai River. The exact day the release of water began is not known but began sometime between Sept. 3 and Sept. 8. The outburst of water from the dump resulted in a 4- to 5-foot wave on the 38-square-mile Skilak Lake and a rise of 3 feet, but no flooding, on the Kenai River. The previous time the lake overflowed, in January 1969, extensive damage occurred to cabins along the lake and the Kenai River. The glacier-dammed lake on Skilak Glacier requires 2 to 3 years to fill to capacity and should not present a flood hazzard again until late 1973.

The first statement warning of possible flooding was issued by the National Weather Service River Forecast Center on Aug. 27. Jokulhlaup statements were issued twice weekly through Sept. 14. Damage to areas that were flooded was minimal as a result of the timely and accurate warnings.

PUERTO RICO

Locally heavy showers caused flooding on the Mayaguesino River, a tributary of the Anasco River on Sept. 2. Minor damages resulted to some houses at the community of Maravilla near the town of Las Marias.

Heavy thundershowers over the northwest central portion of Puerto Rico during the afternoon of the 8th caused some minor flooding in Aguada and Aguadilla. Some people living near the river in the town of Aguada were evacuated by the Civil Defense.

Note: All observations scheduled at 1200, G.c.t. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.c.t.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter.

Values with an asterisk are interpolated.

U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day [illegible] at Palmer, Alaska

[illegible] SEPTEMBER 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	12	92	23	115	22	2	18	98	50	165	98	89	70	109	-10	-108	61	94	-21	83	89	35	87	-27	72	58	23	7	8	8		46

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

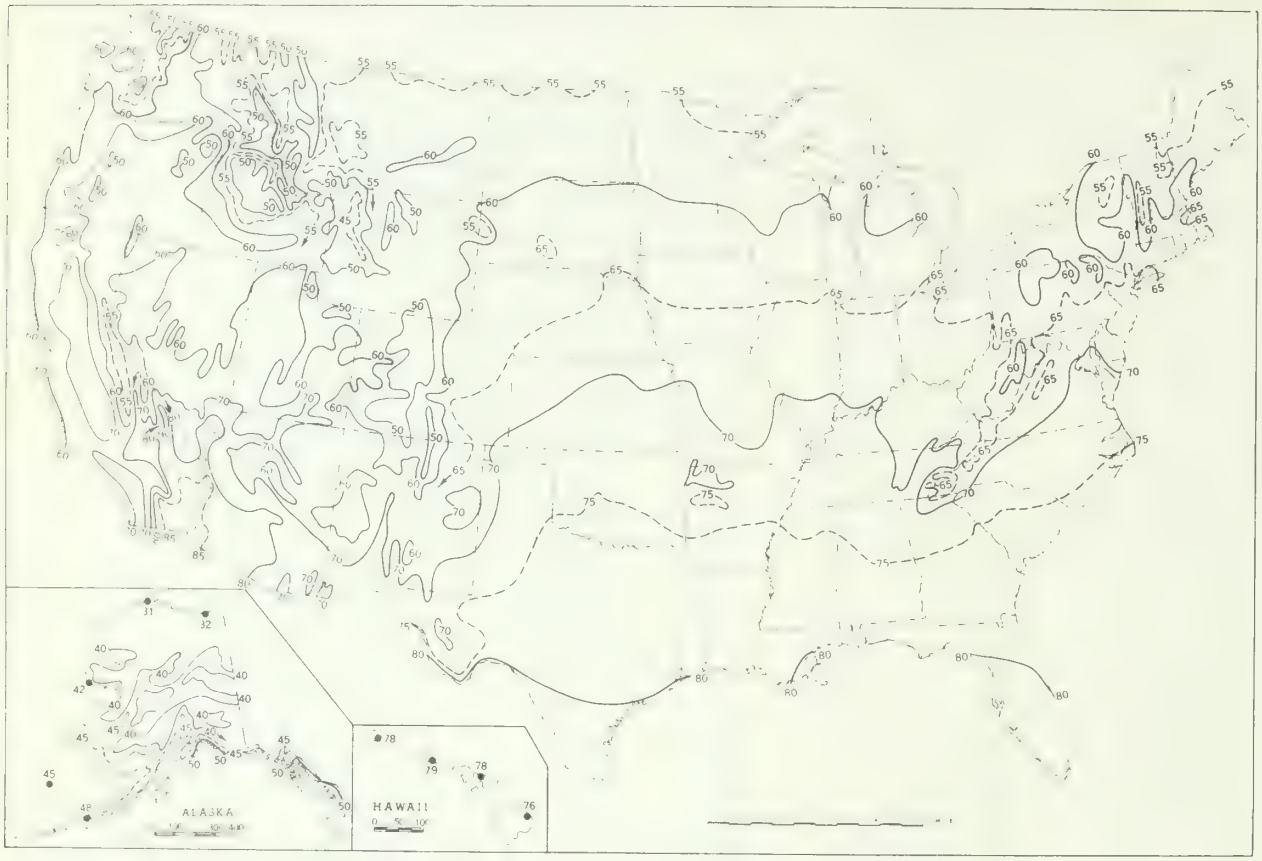
Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	NO DATA - MACHINE MALFUNCTION																															

These data are from an E - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. Data instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."



Units: Milli-atmo-cms.

[illegible]

[illegible] Standard temp.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), September.

B. Temperature Departure from 30 - Year Mean (°F 1931-60), September 1971

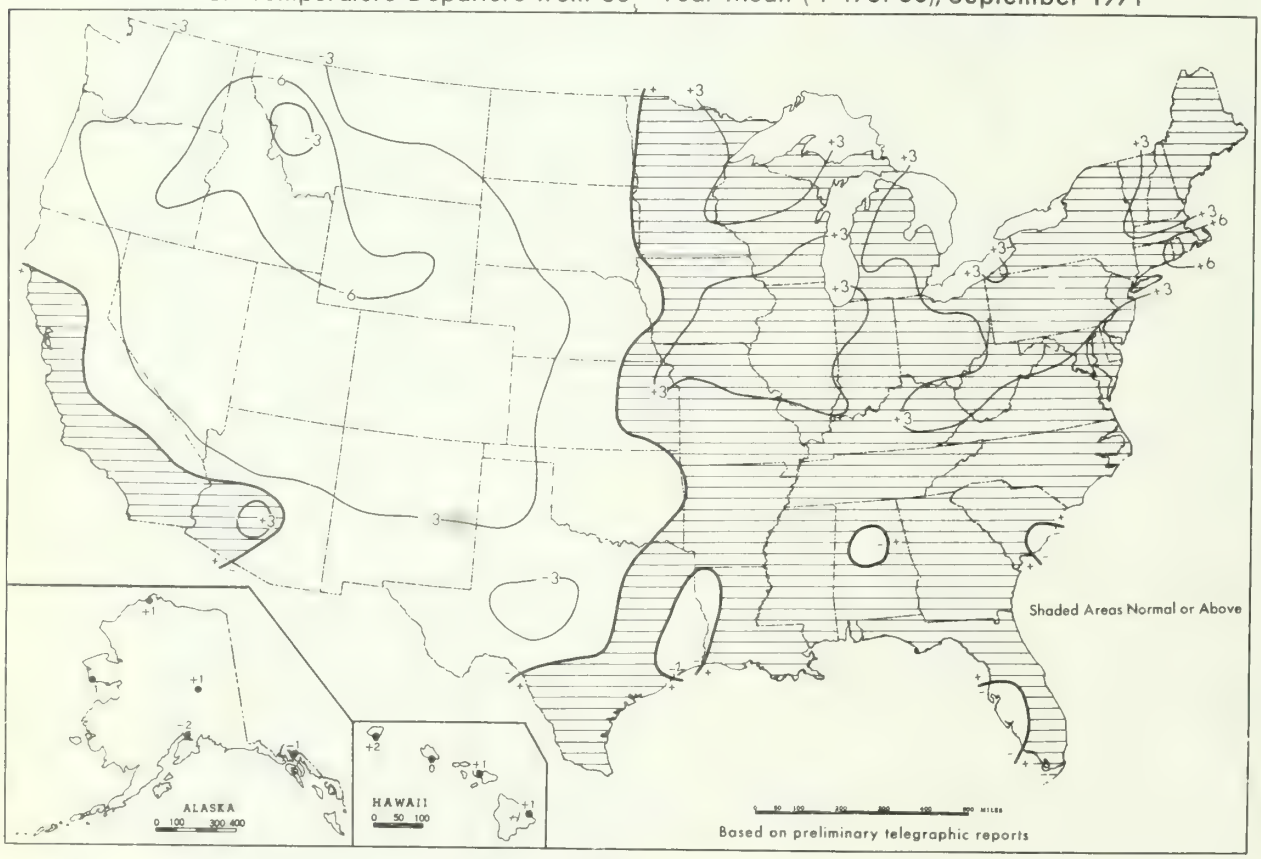

Chart II. Total Precipitation (Inches), September 1971.

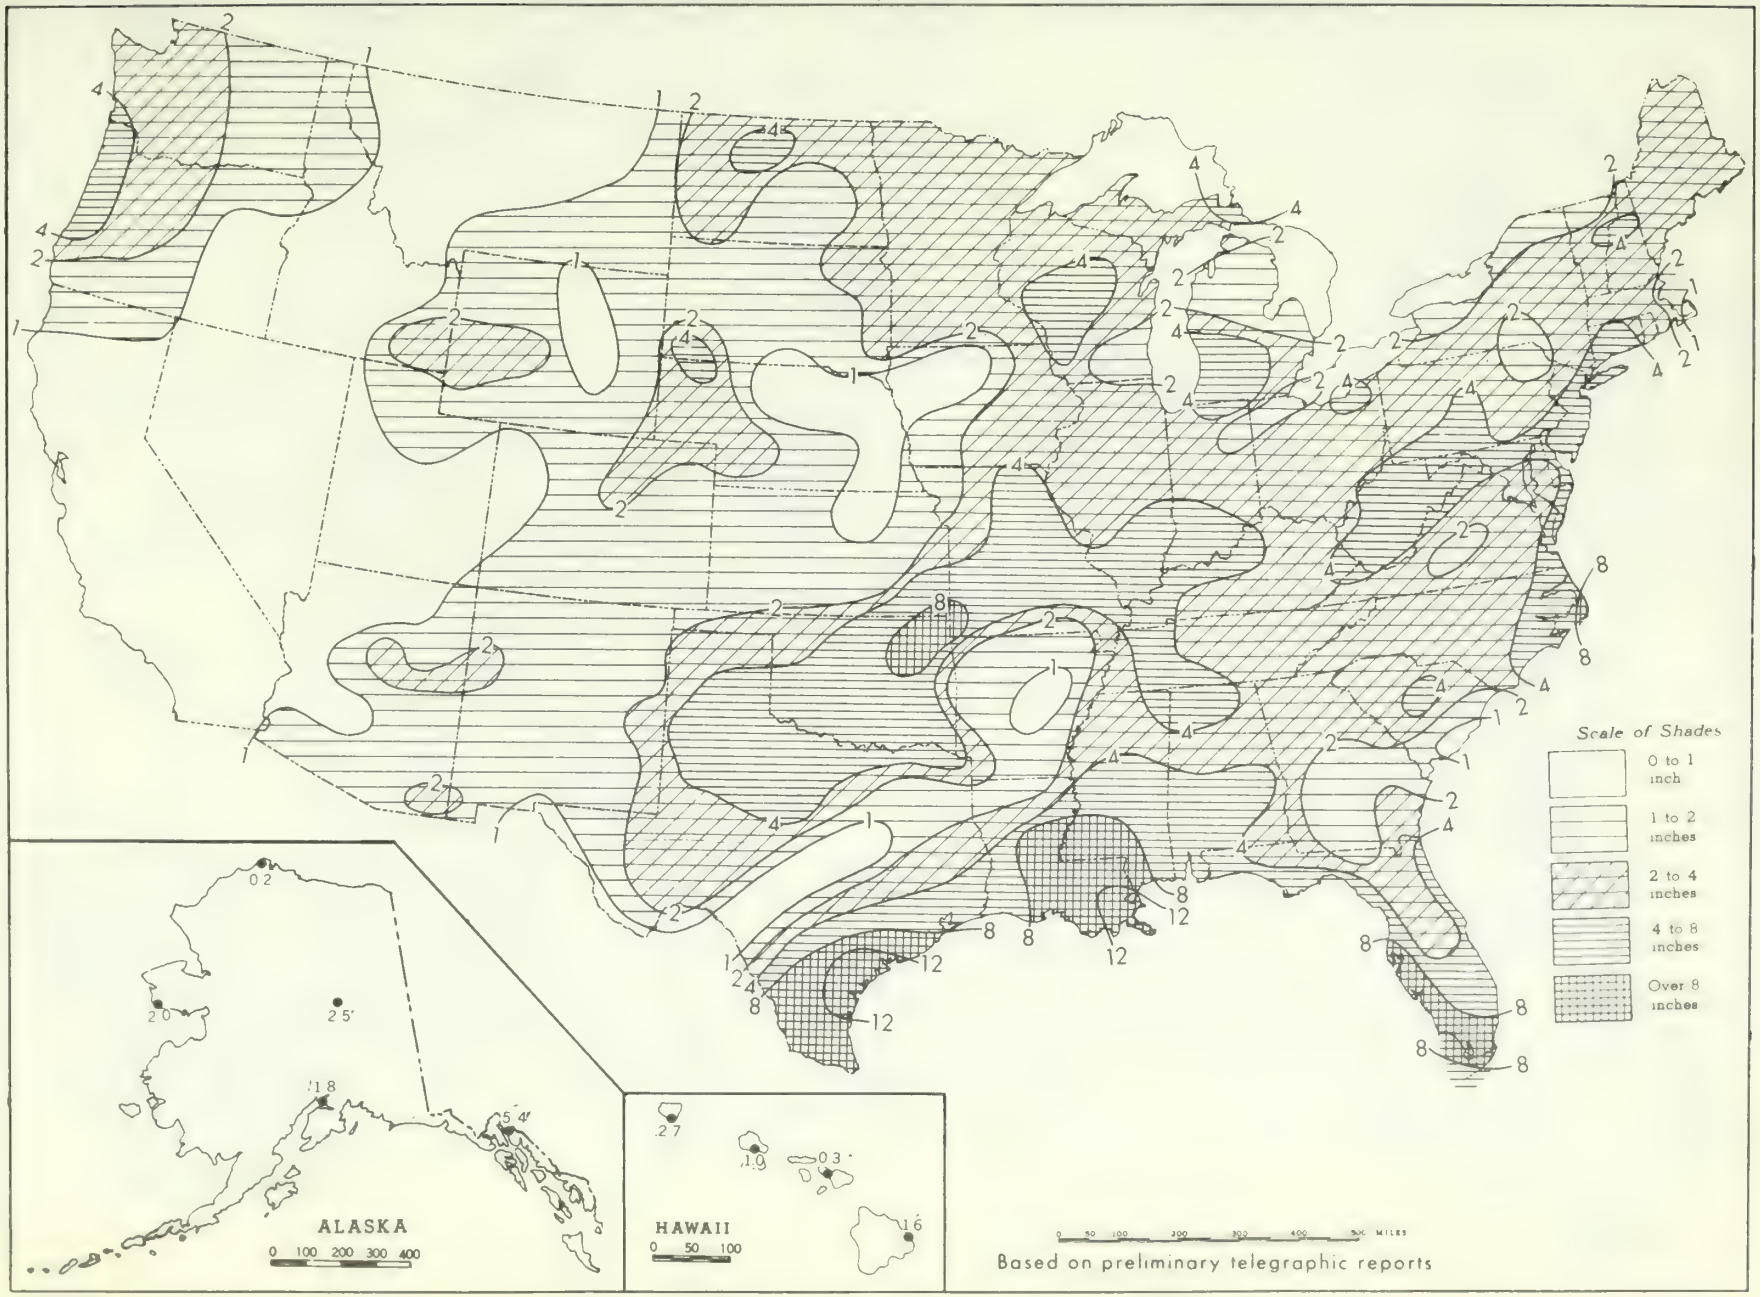

Chart III. Percentage of Normal Precipitation, September 1971.

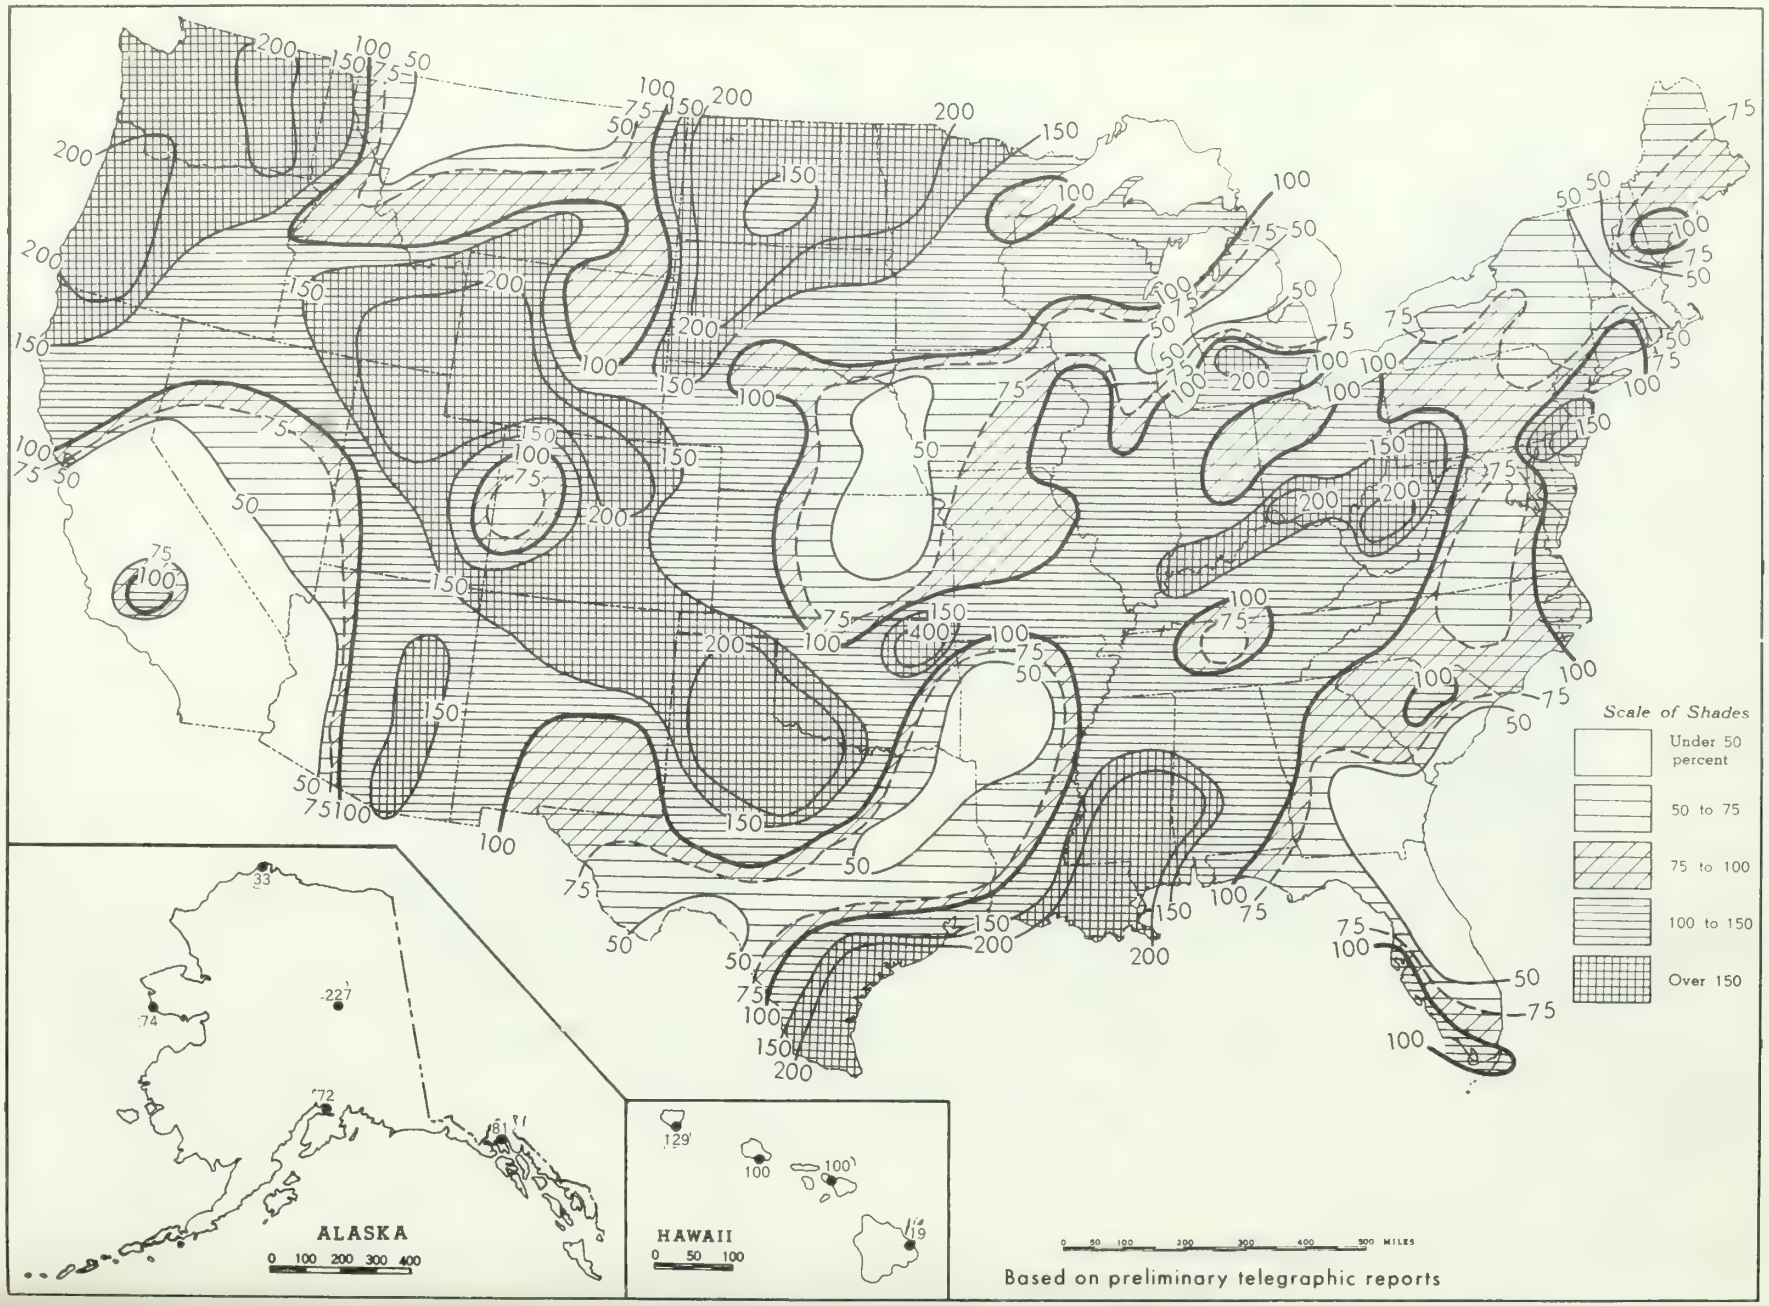

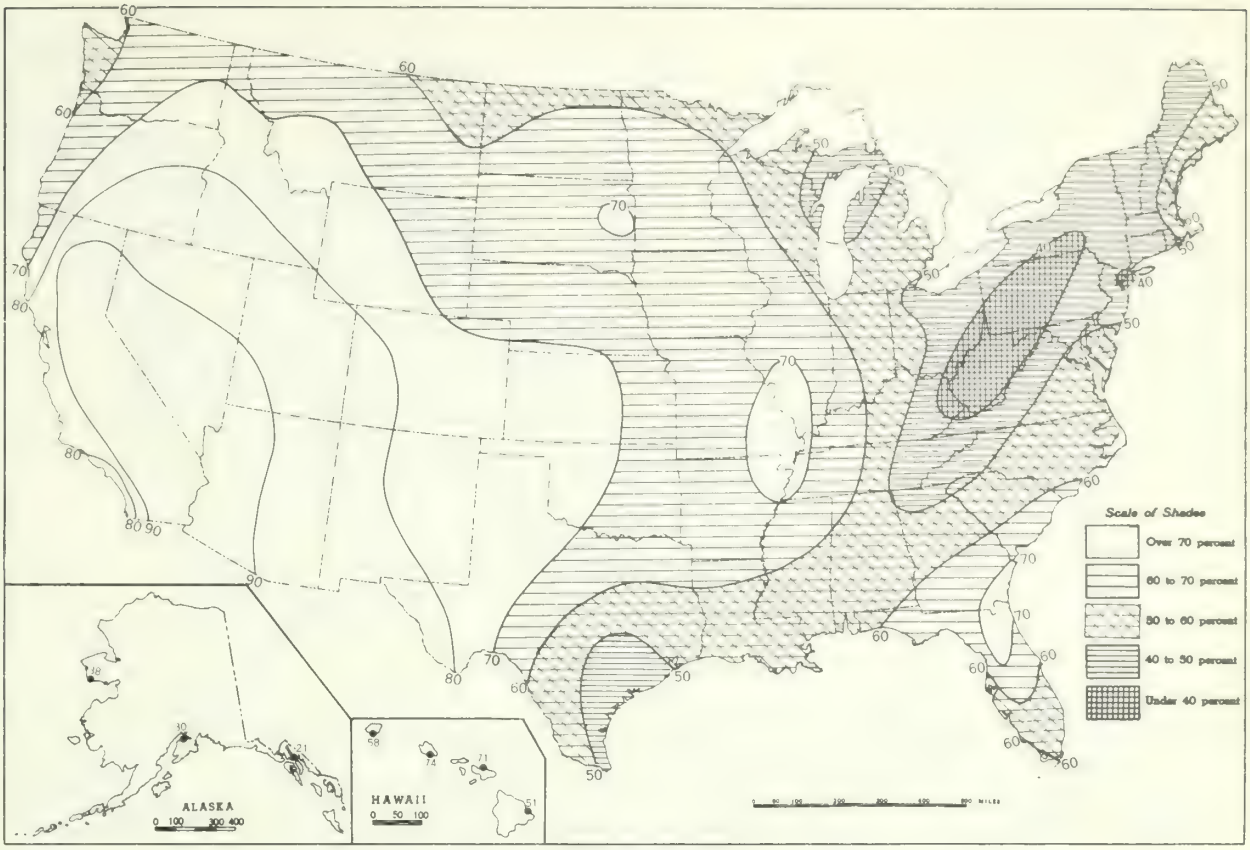

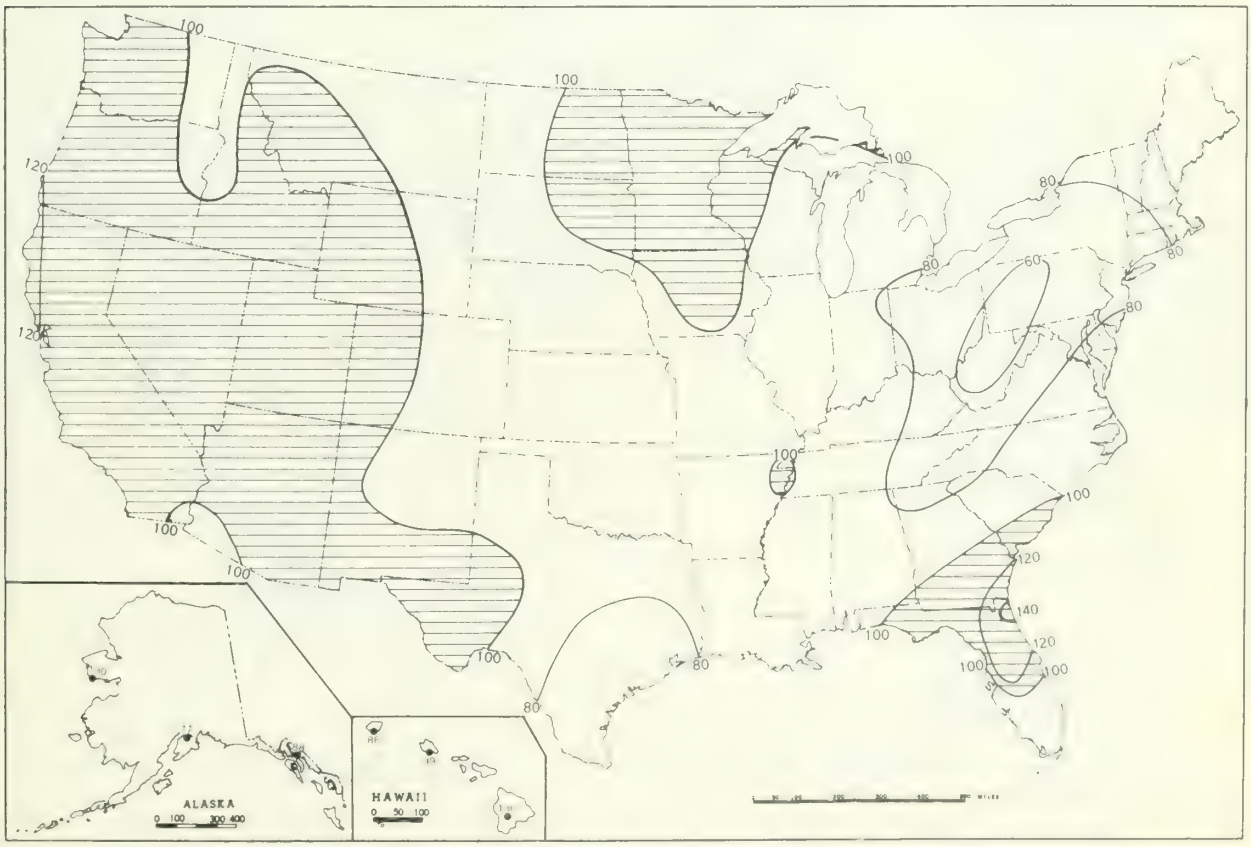

Chart VI. A. Percentage of Possible Sunshine, September 1971.

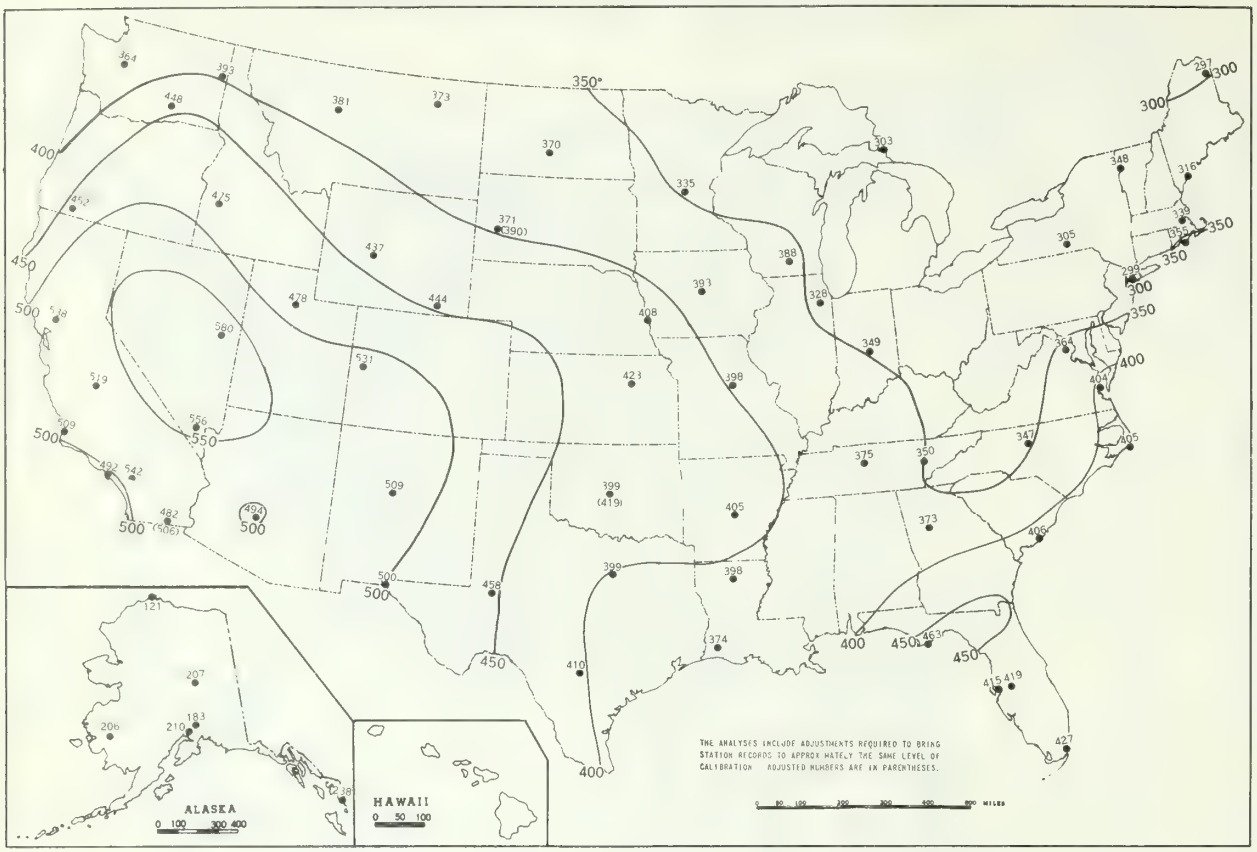
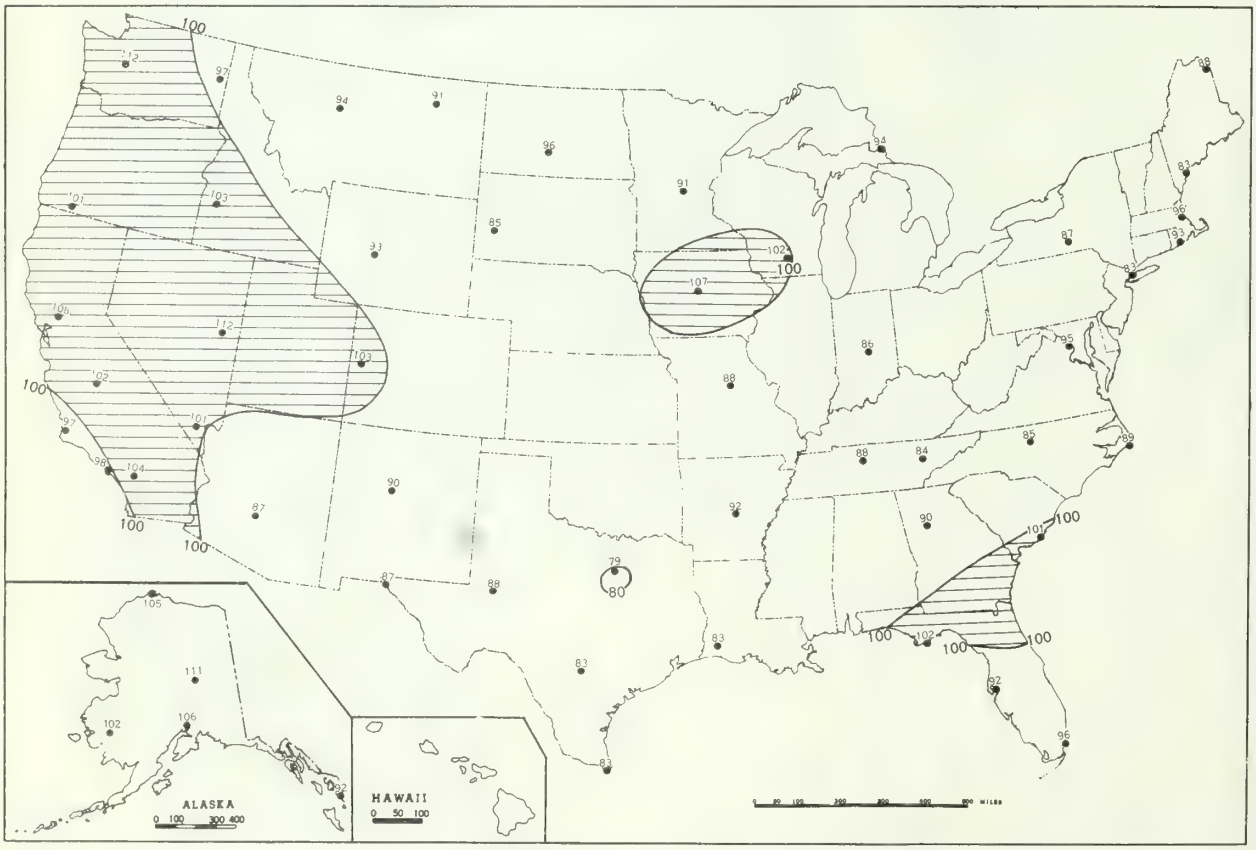
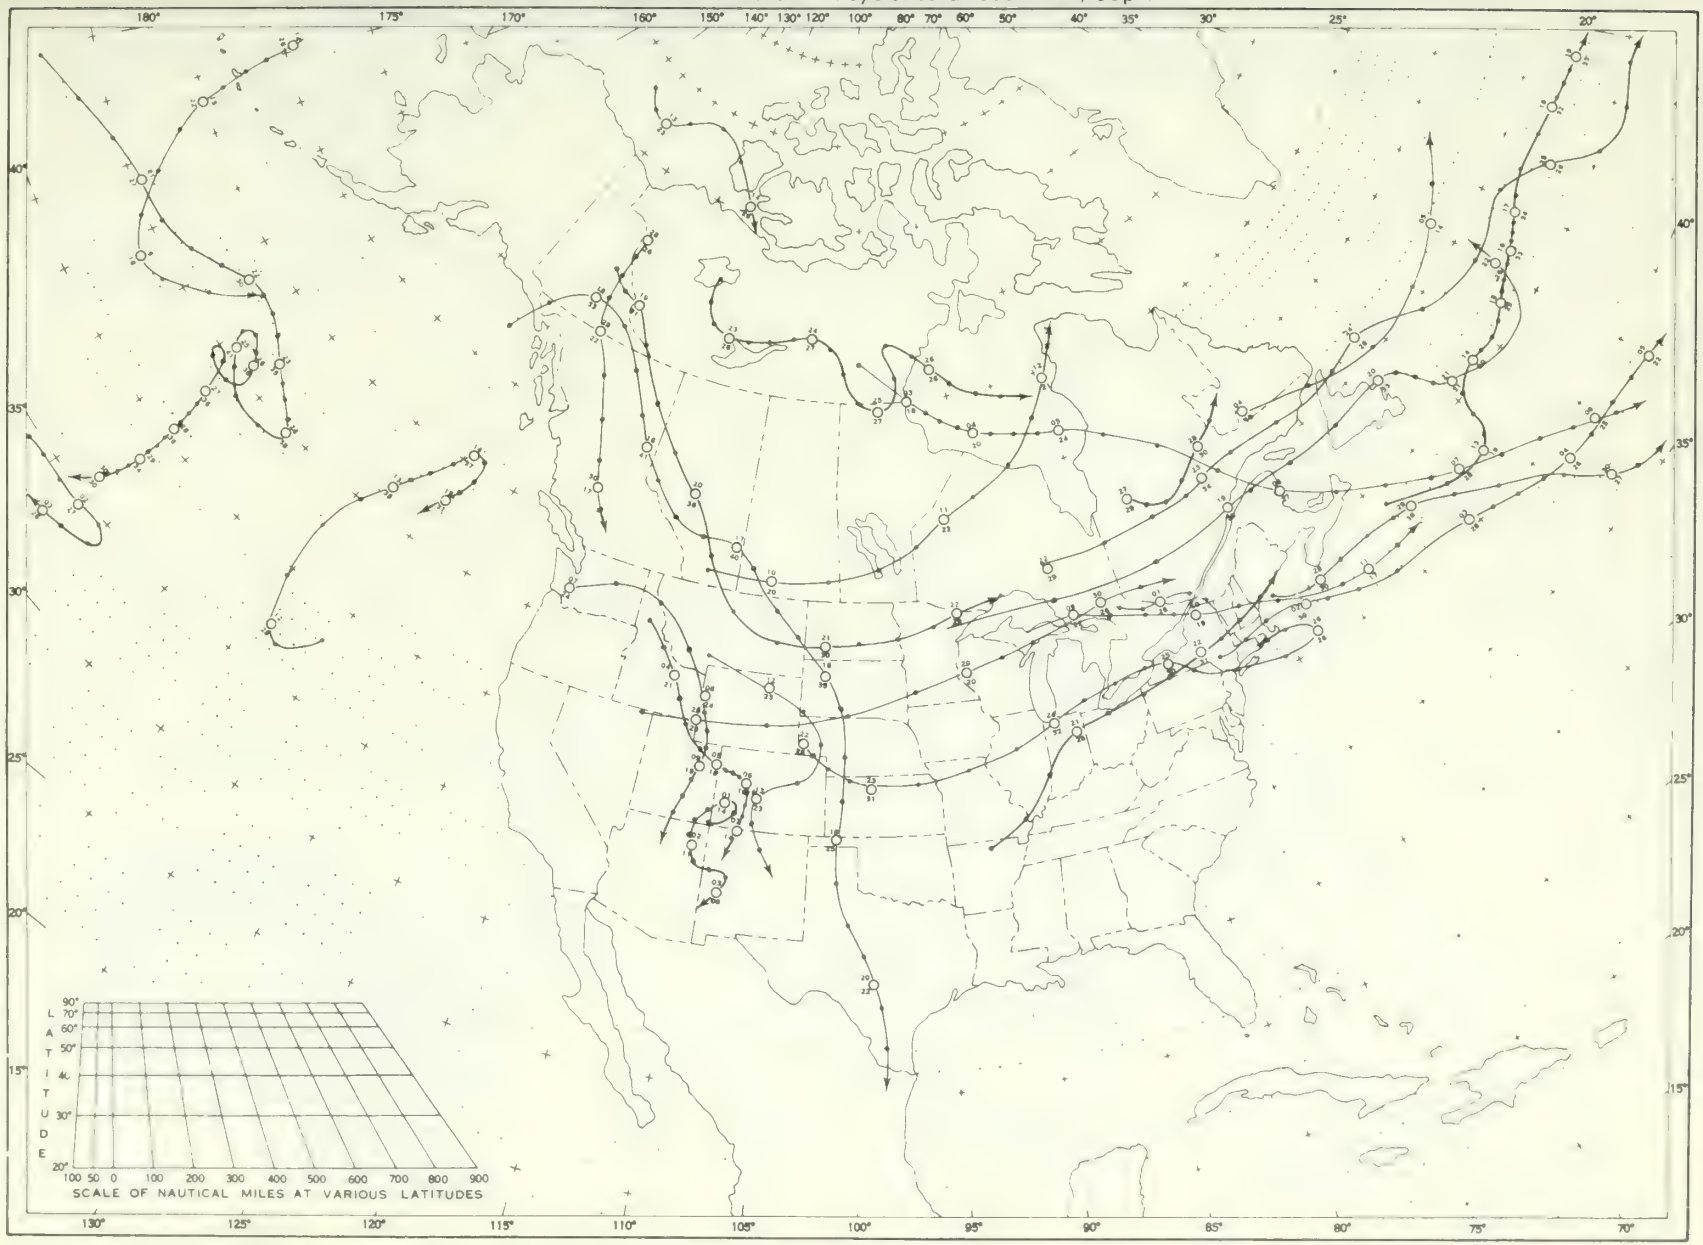


B. Percentage of Mean Monthly Sunshine, September 1971.

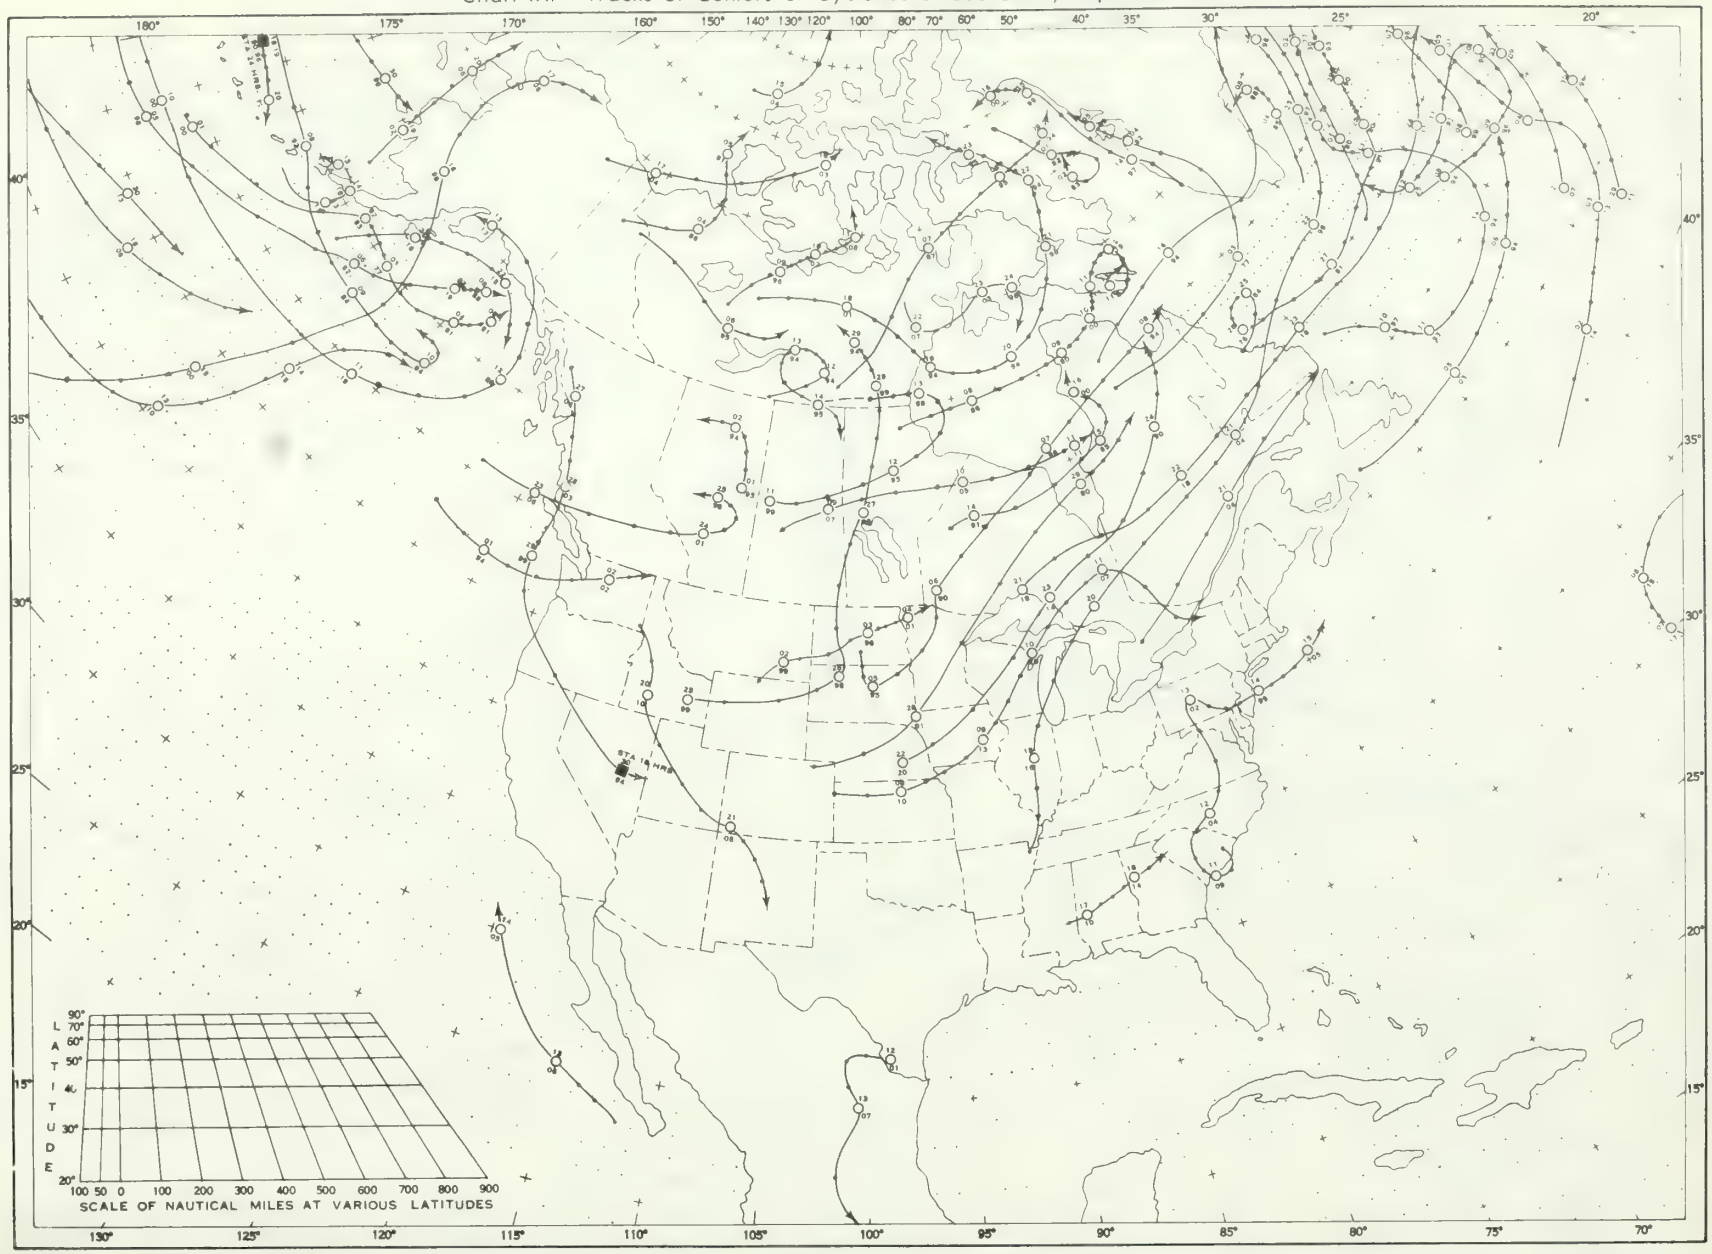


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, September 1971

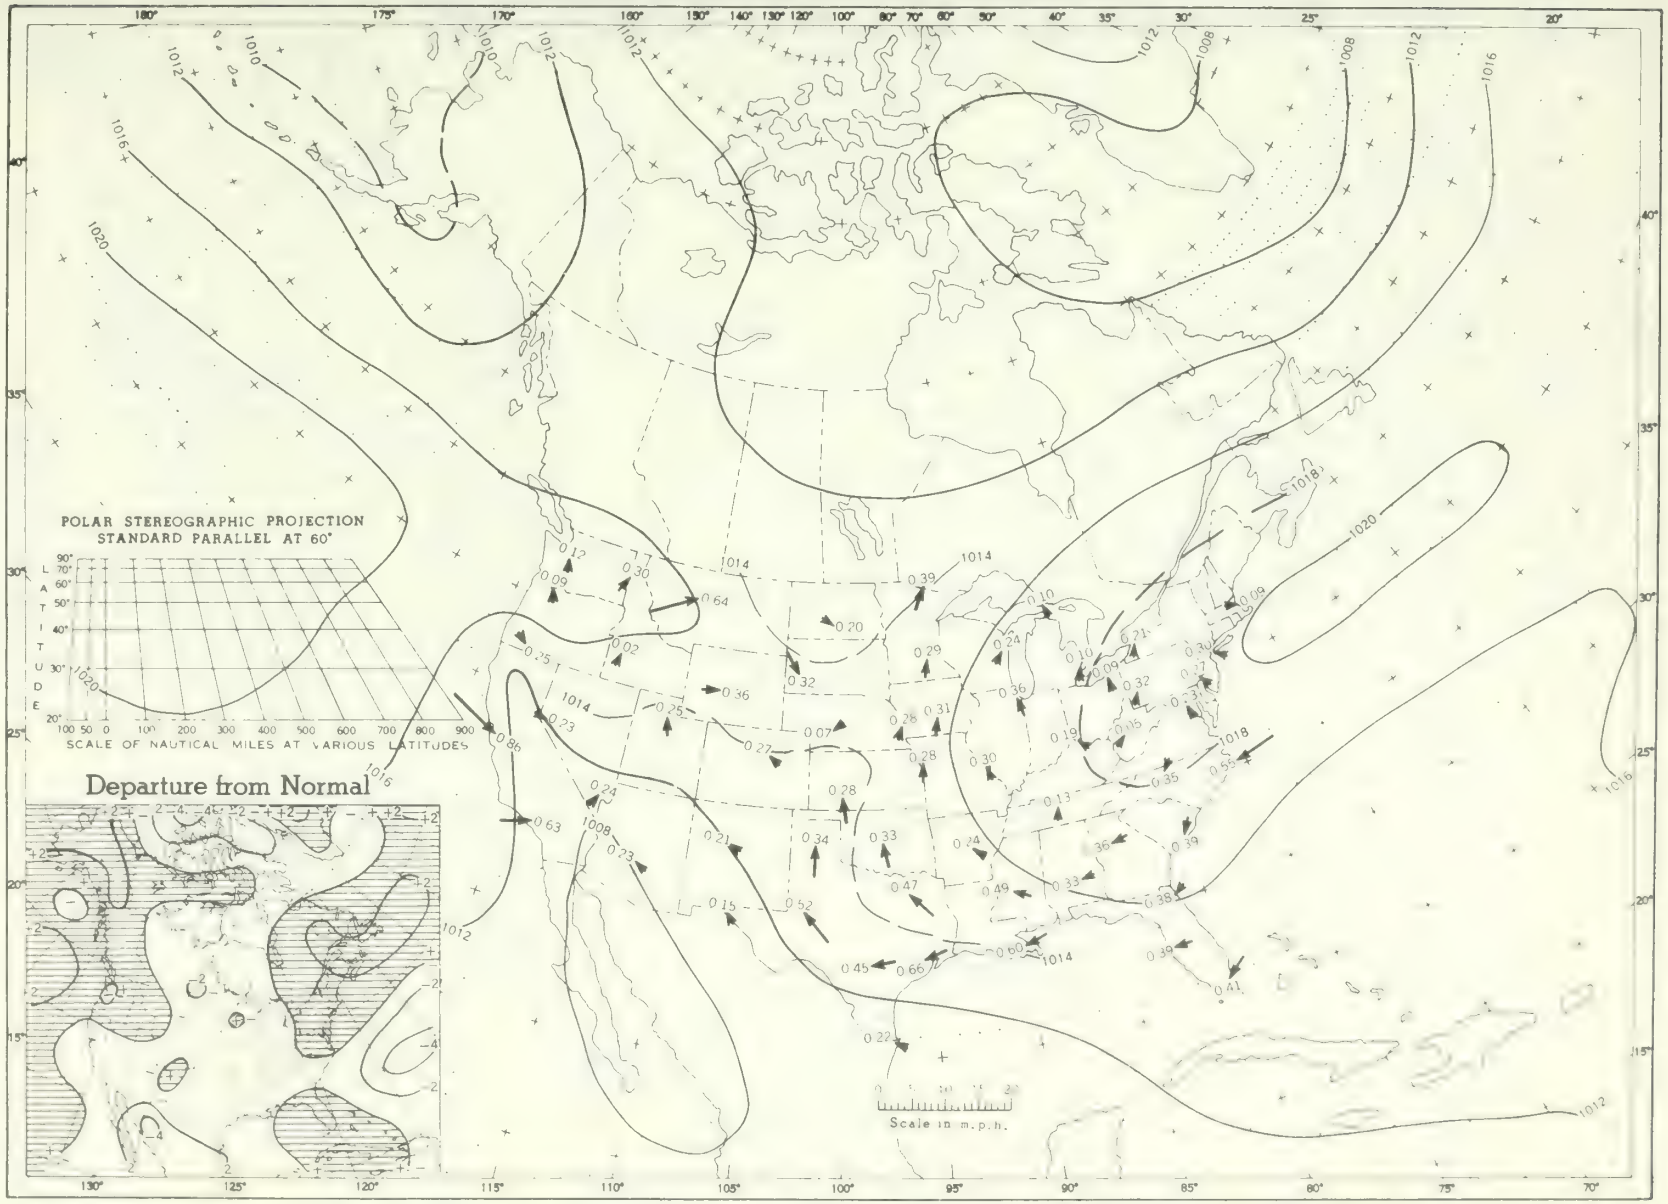


B. Percentage of Mean Daily Solar Radiation, September 1971.



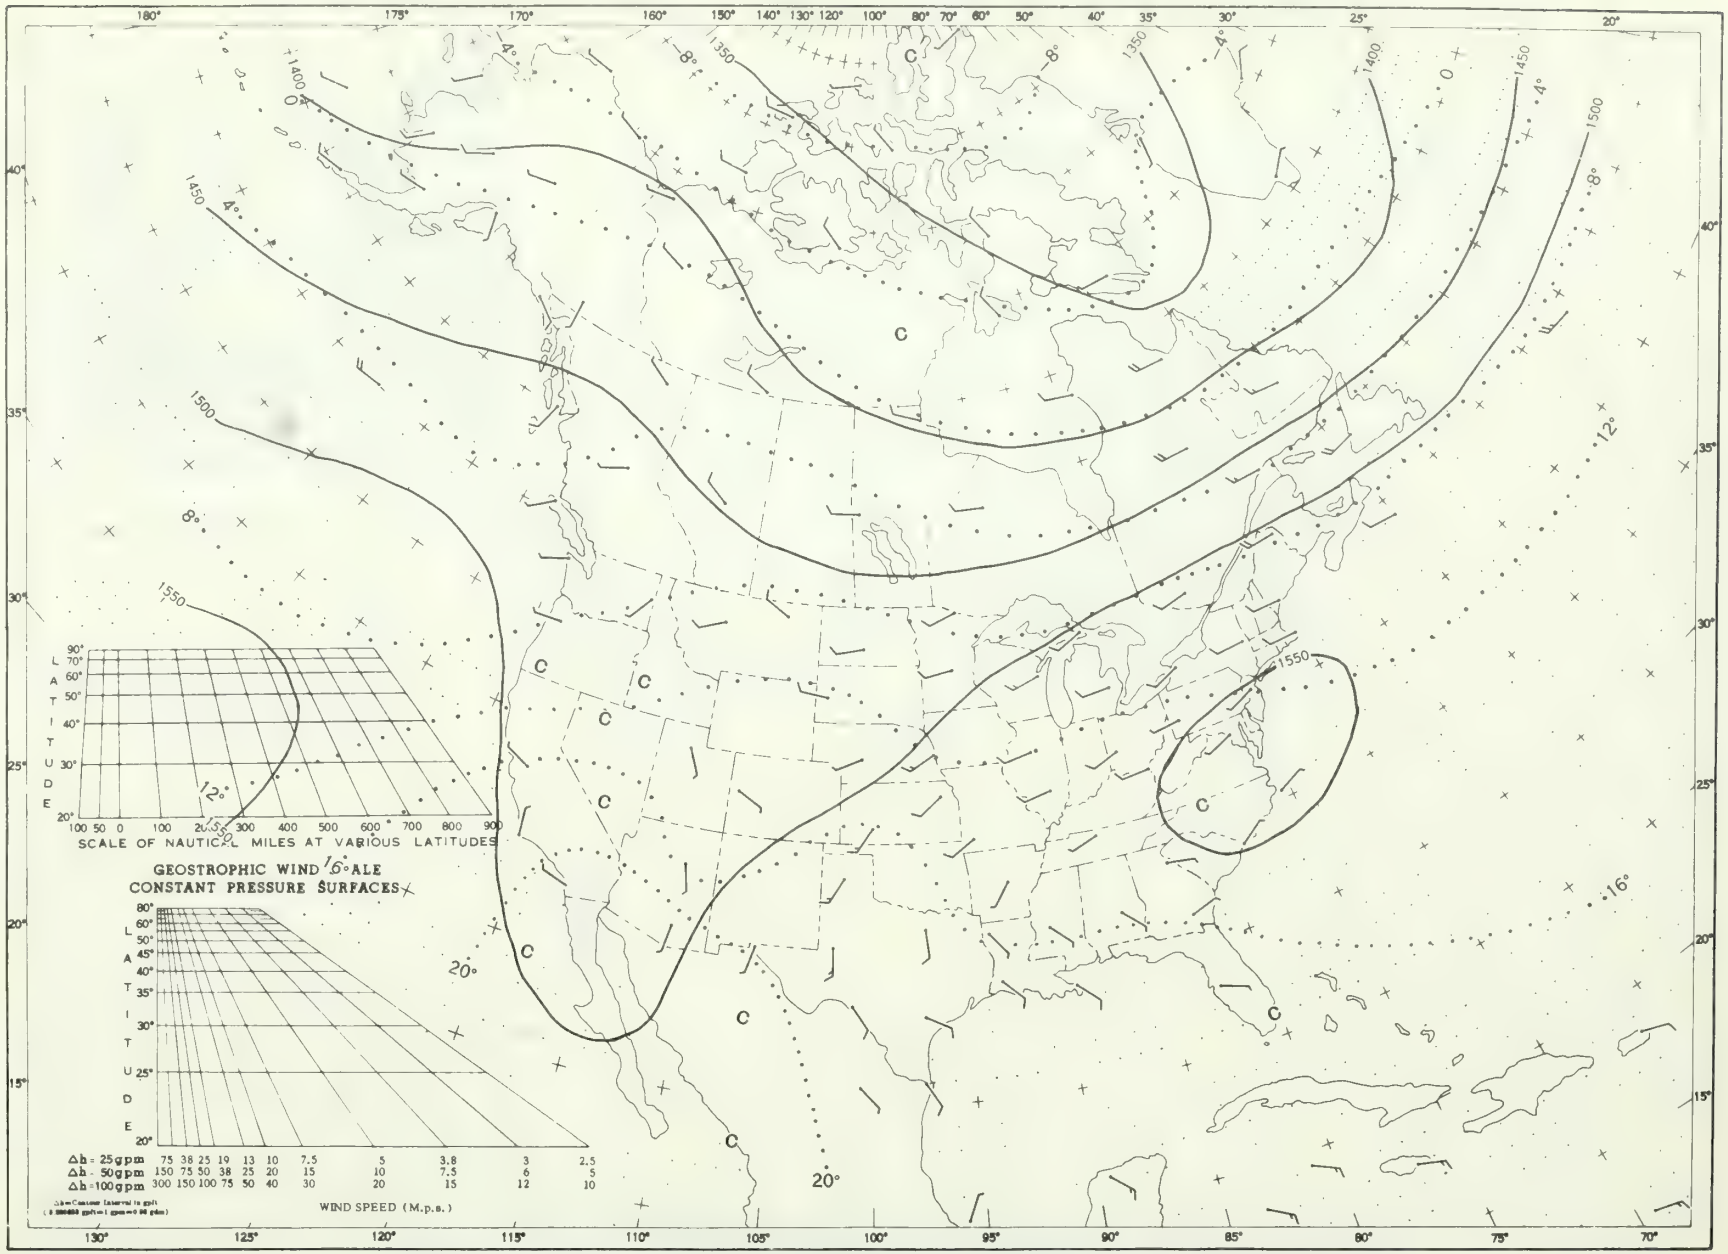
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, September 1971.



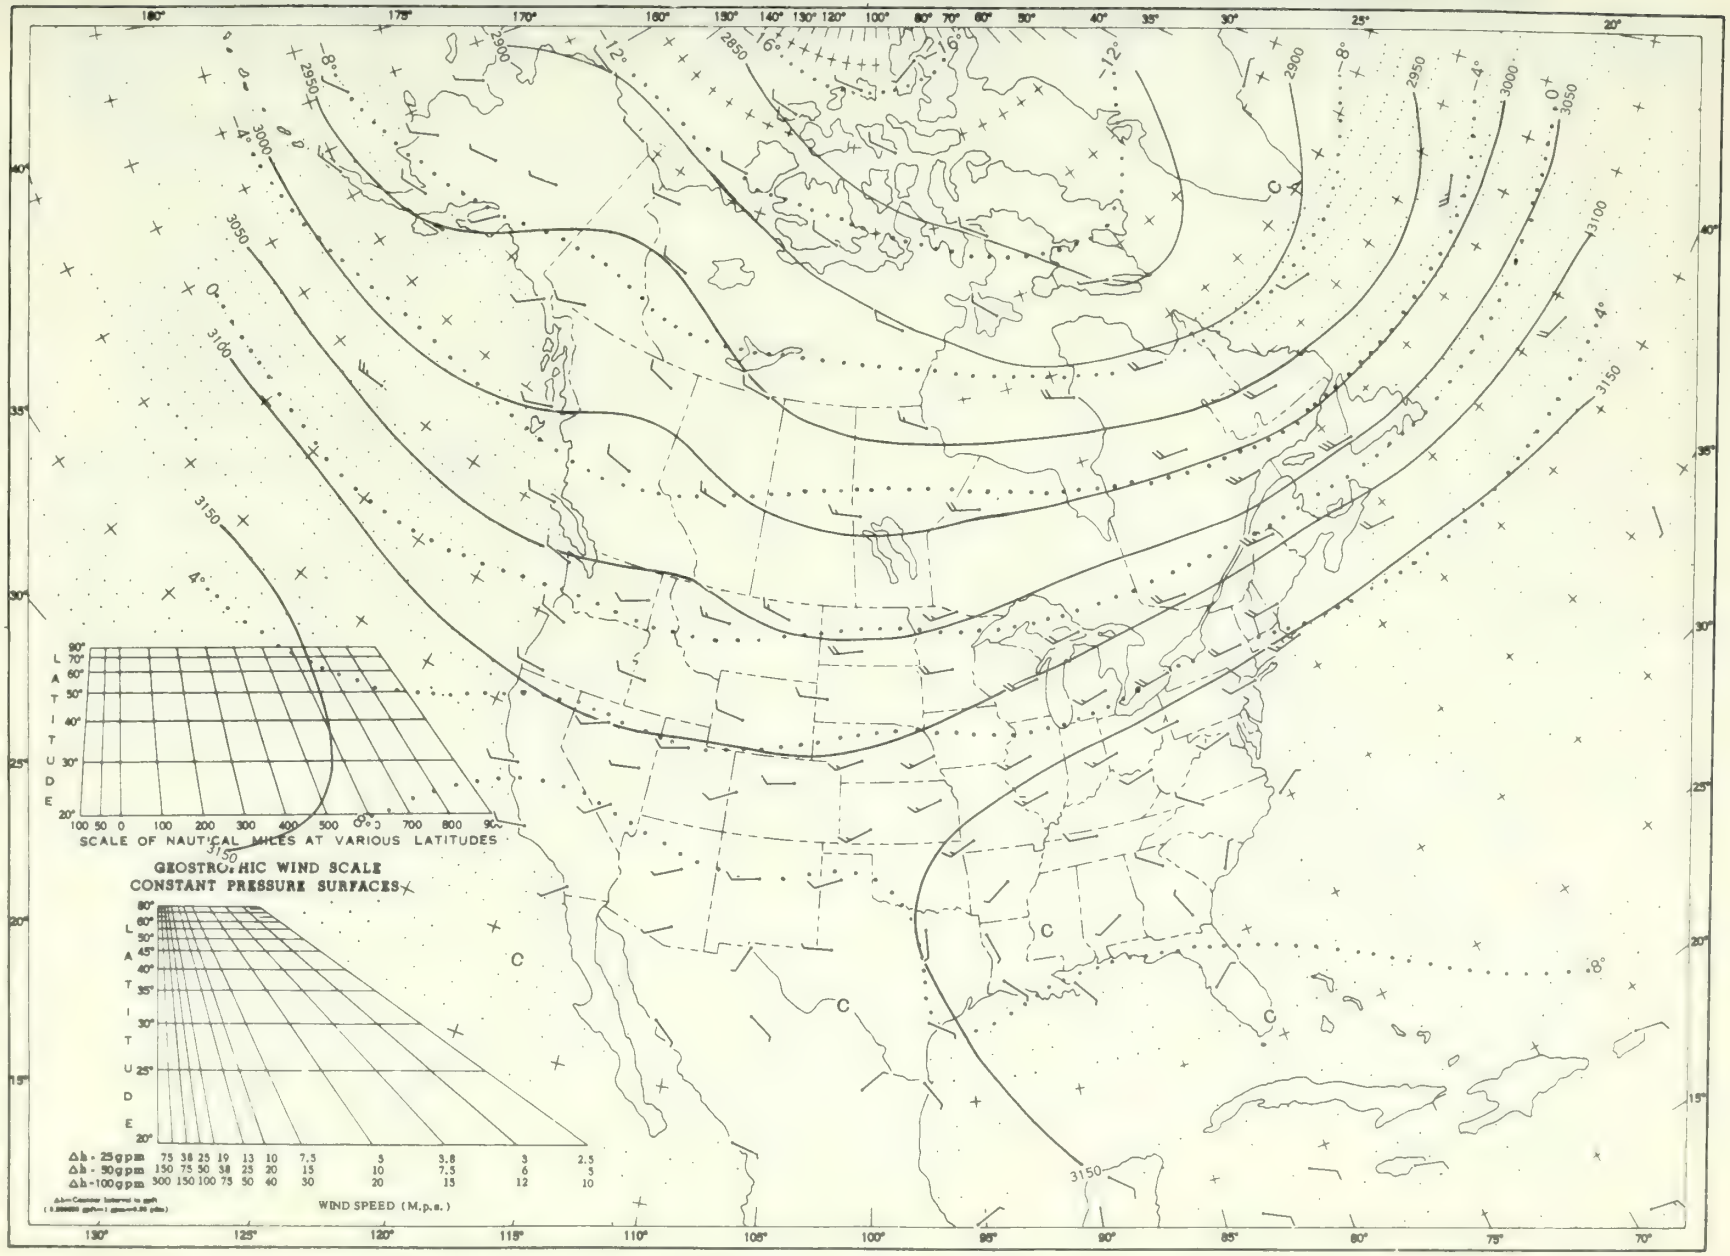
Circle indicates position of center at 7:00 a.m. e.s.t. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, September 1971.



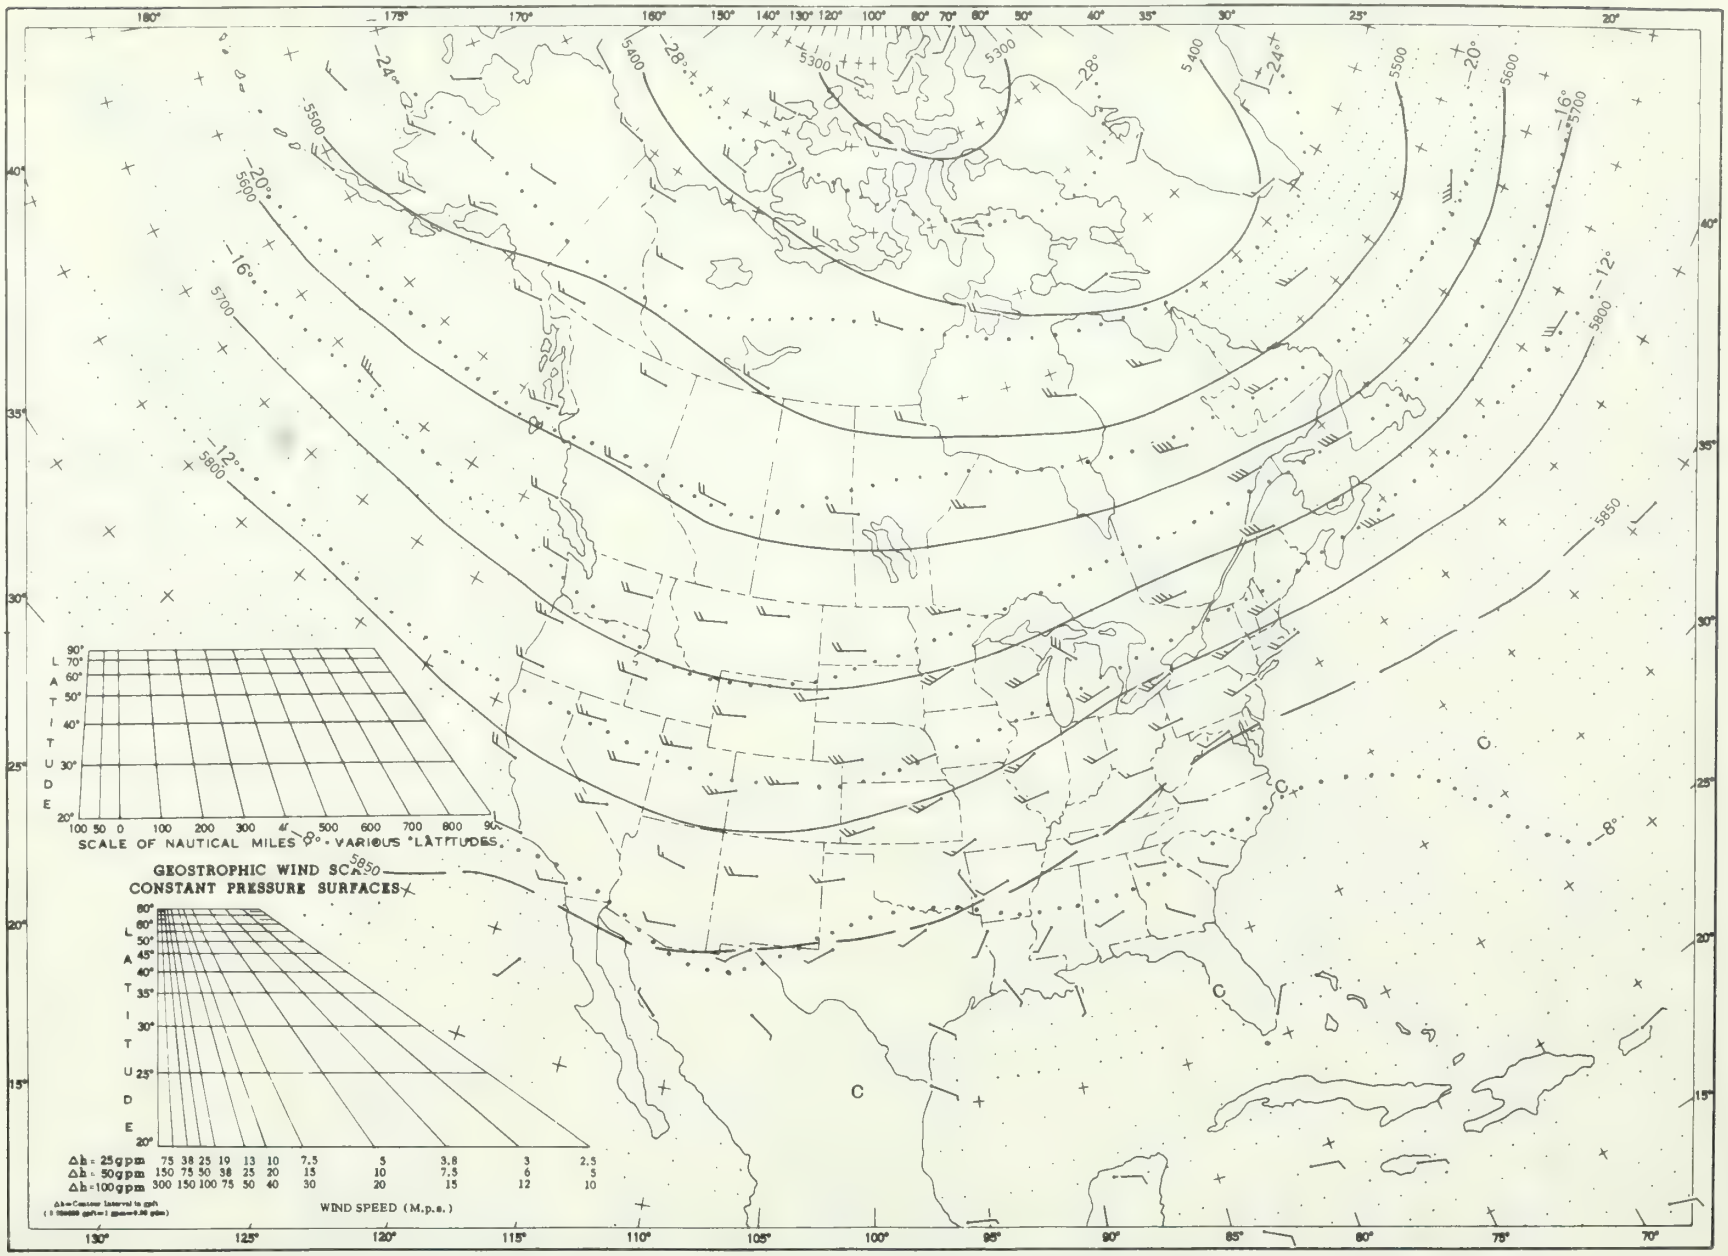
Circle indicates position of center at 7:00 a.m. e.s.t. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, September 1971. Inset: Departure of Average Pressure (mb) from Normal, September 1971.



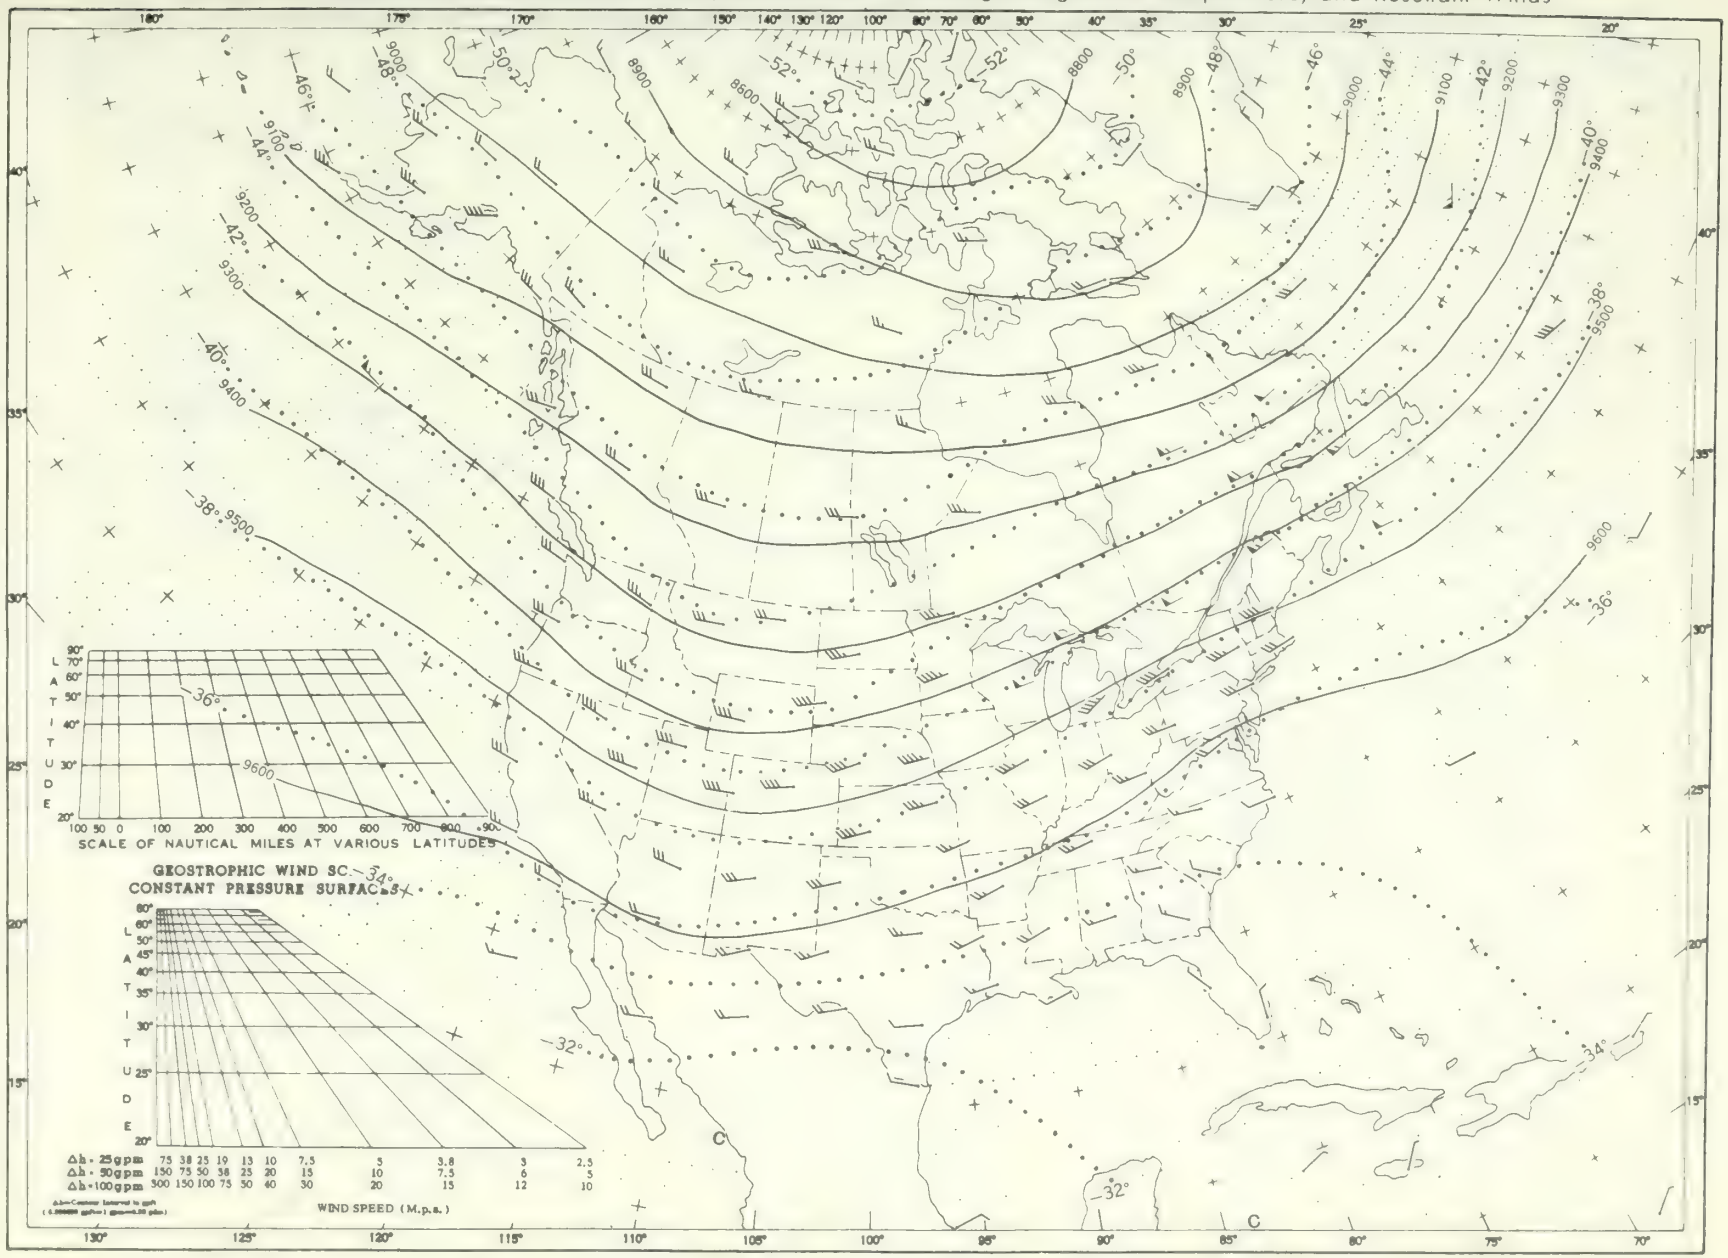
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed ÷ average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 G.m.t., September 1971. Average Height and Temperature, and Resultant Winds.



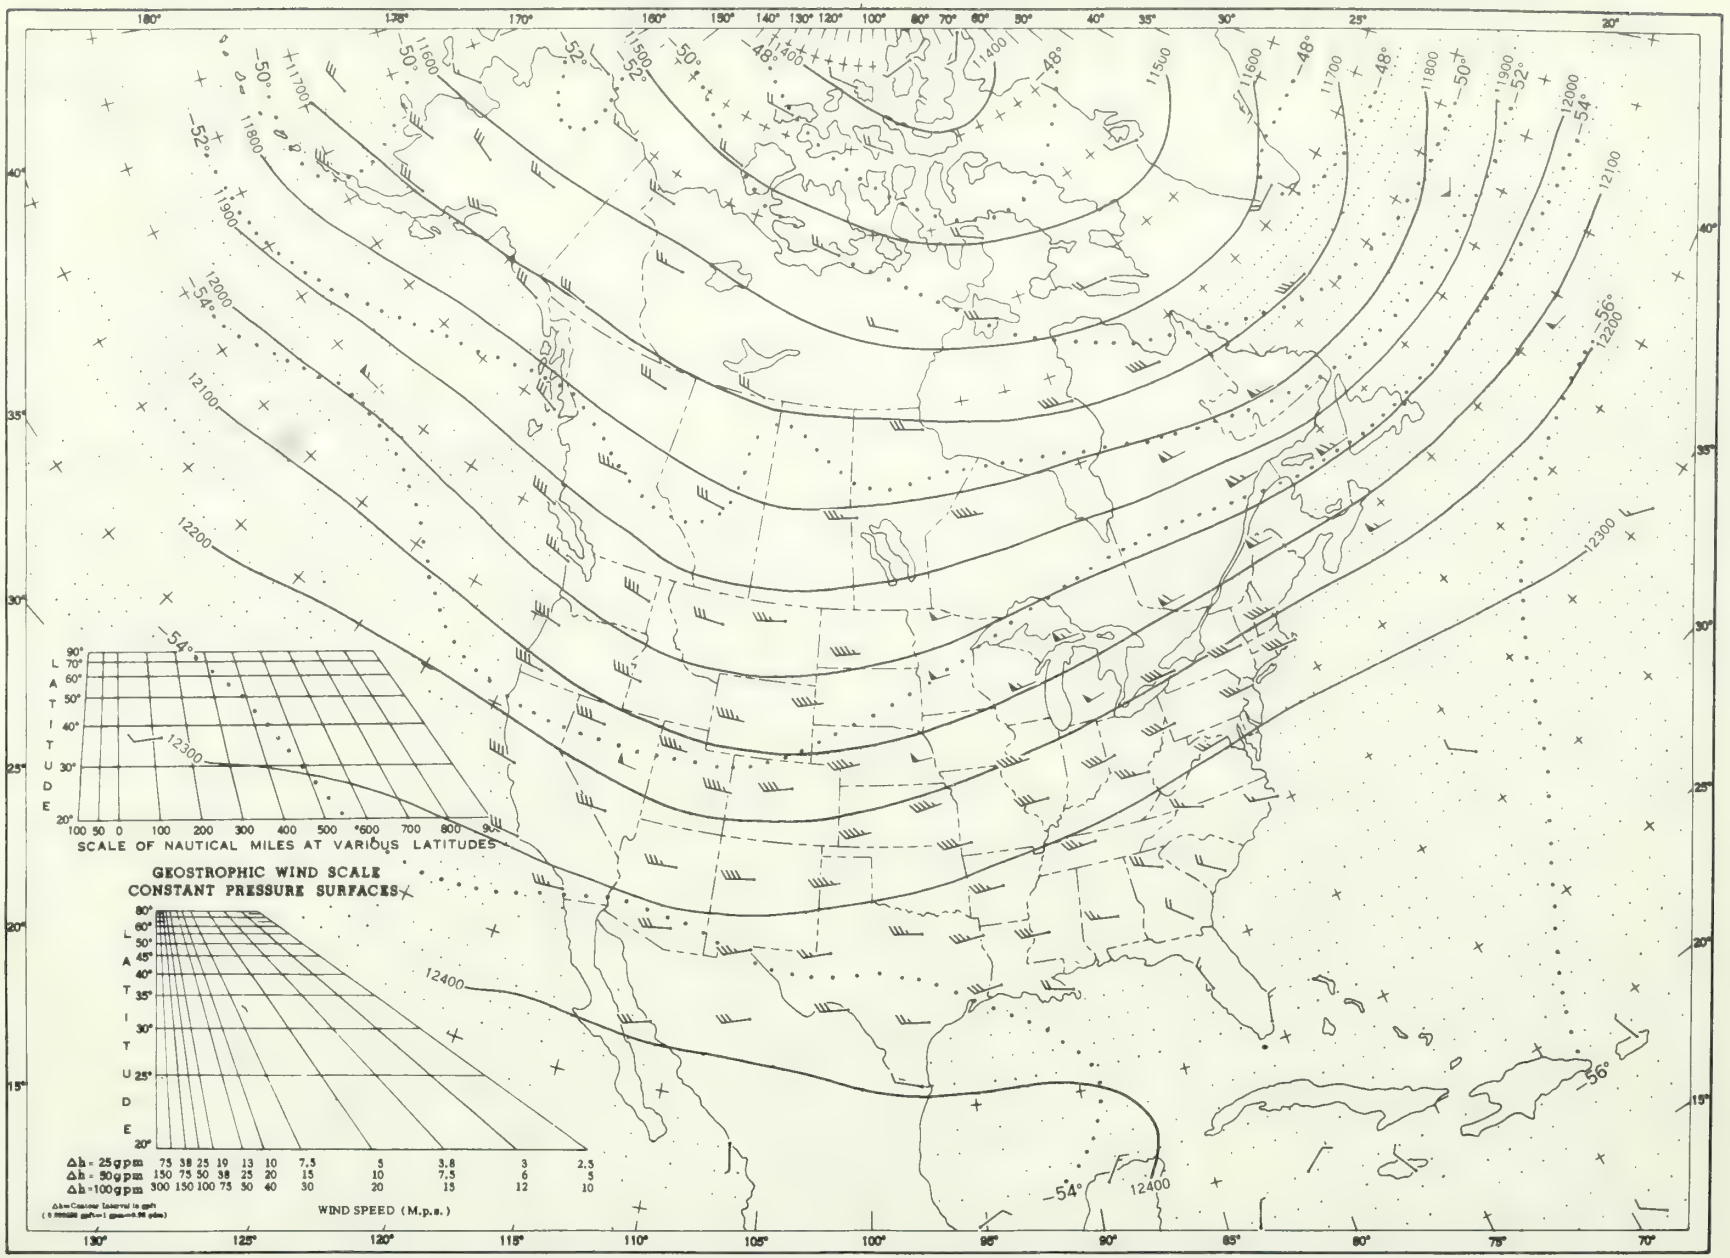
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 G.m.t., September 1971. Average Height and Temperature, and Resultant Winds.



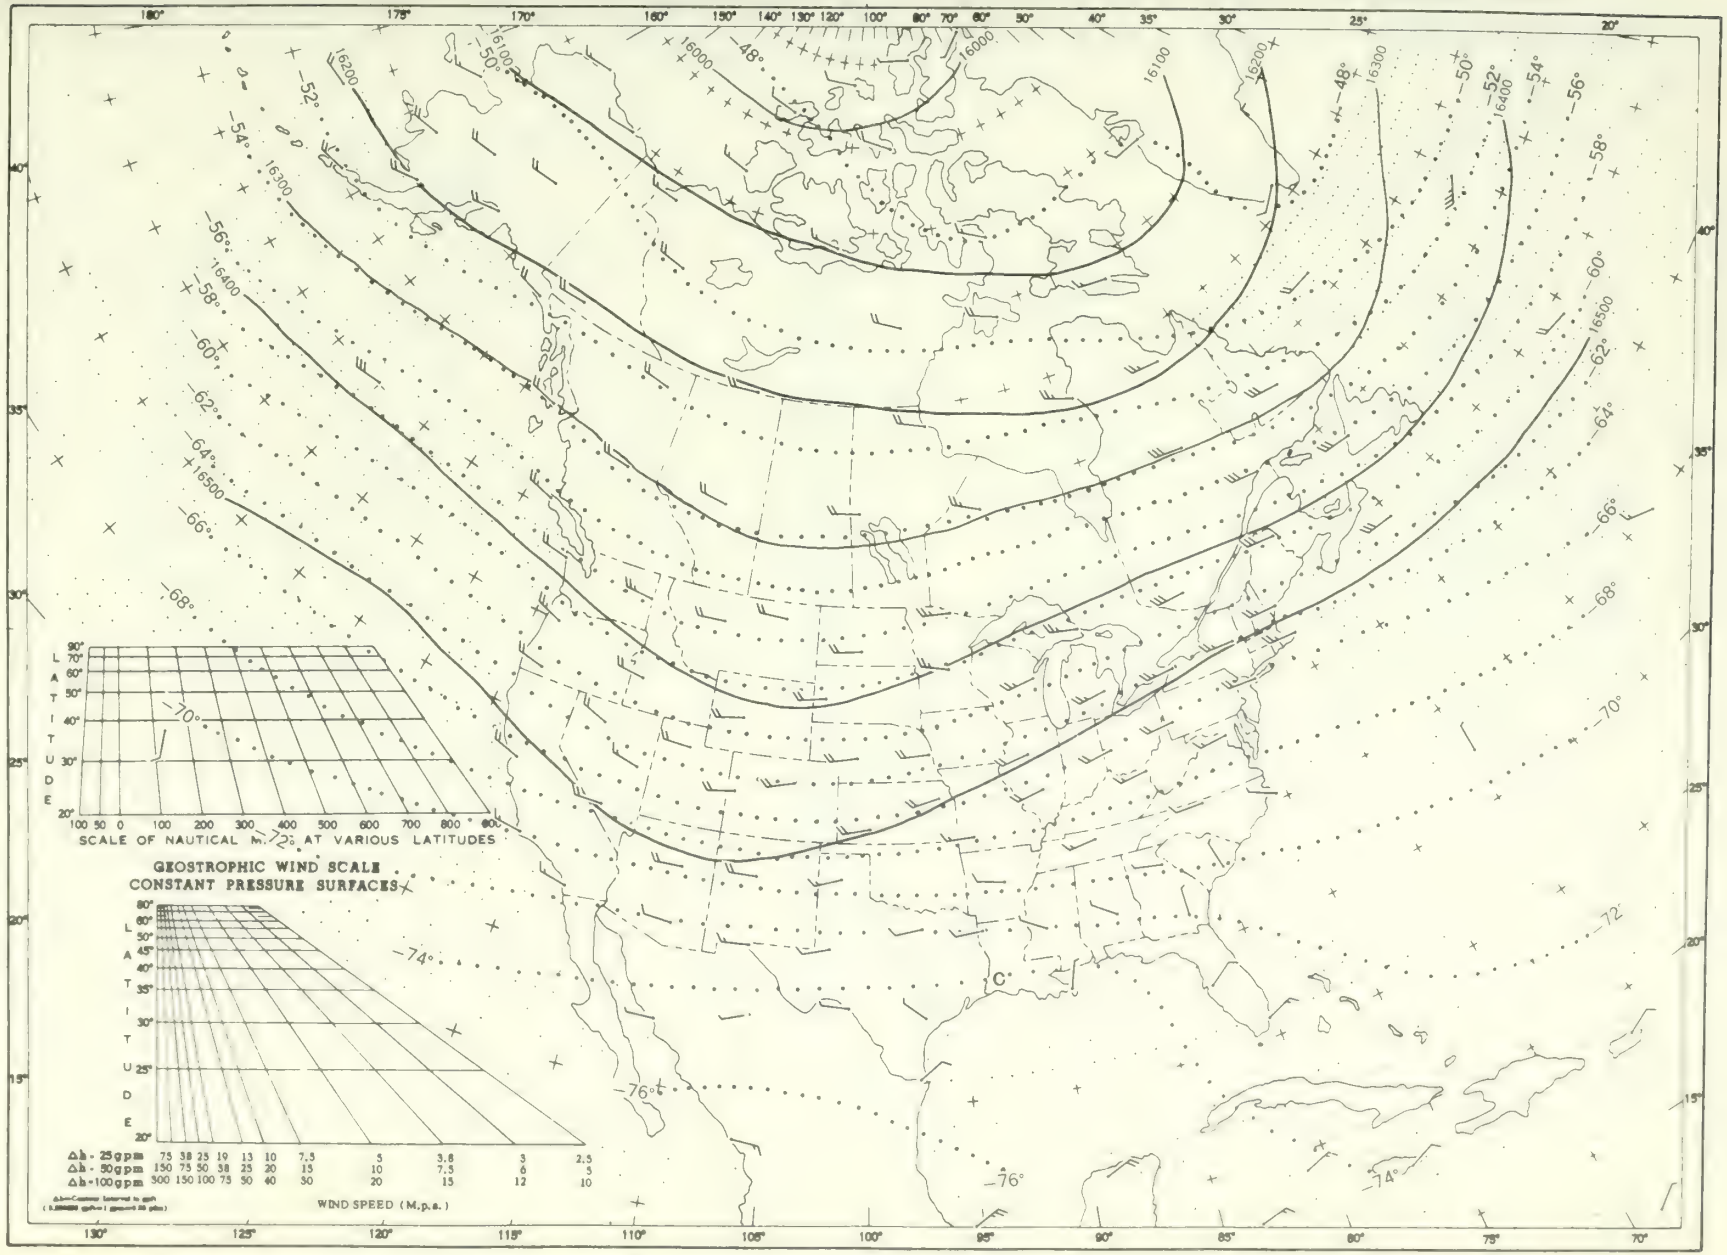
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 G.m.t., September 1971 Average Height and Temperature, and Resultant Winds



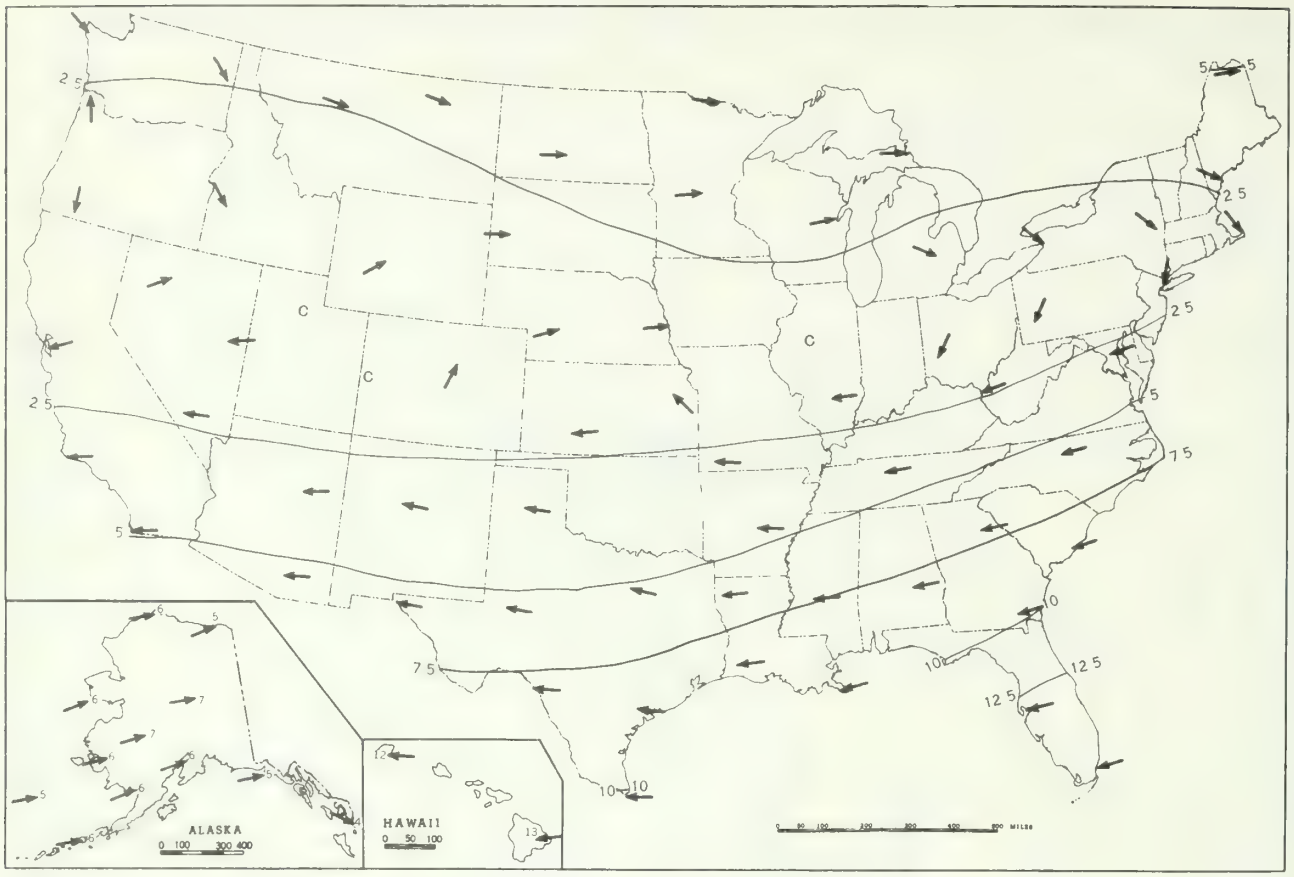
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 G.m.t., September 1971. Average Height and Temperature, and Resultant Winds



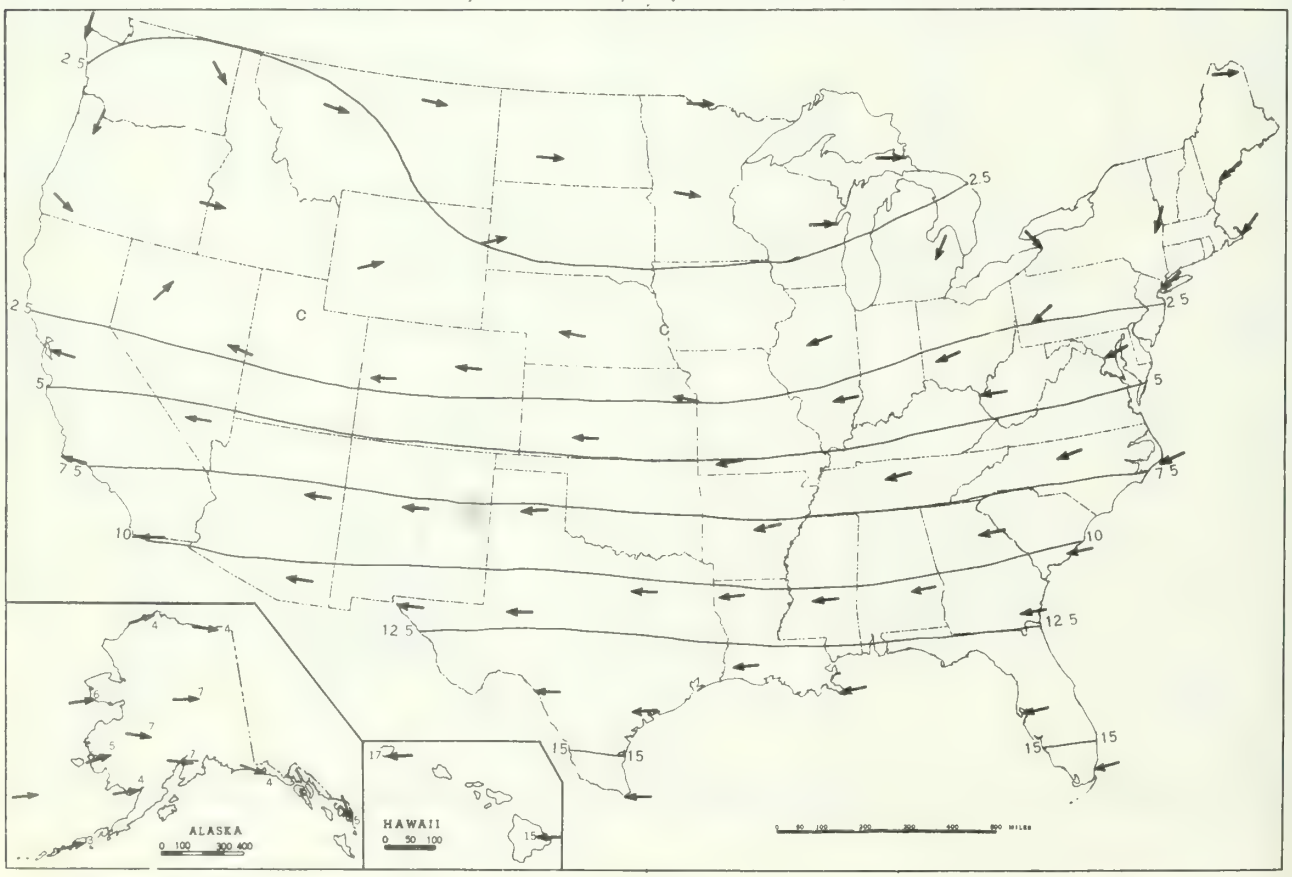
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV. 200-mb. Surface, 1200 G.m.t., September 1971. Average Height and Temperature, and Resultant Winds.



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 G.m.t. September 1971. Average Height and Temperature, and Resultant Winds.



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 G.m.t., September 1971. Resultant Winds.

B. 30-mb. Surface, 1200 G.m.t., September 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

Washington, D. C.

OCTOBER 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. For the second consecutive month, below-normal temperatures prevailed from the Pacific Ocean to the western edge of the Great Plains and above-normal temperatures predominated over the eastern half of the Nation.
2. Heavy rains occurred over the northern Great Plains and over portions of the eastern Seaboard.
3. Recordbreaking snowfall occurred in spots in the Great Basin and the Rocky Mountains.

TEMPERATURE--For the second consecutive month, temperatures averaged below normal over the western half of the Nation and above normal over the eastern portion. Temperature departures over the western half were generally 3° below normal, with a few high elevation stations reporting departures of -6°. The eastern half of the Nation was generally 4° above normal, with temperatures across the Corn Belt averaging 6° to 7° above normal.

After starting the month on a cool note, the western one-third of the Nation enjoyed warm days and cool nights, with temperatures averaging 3° to 6° above normal during the first 10 days of the month. The remainder of the Nation, except for the New England area and parts of the Southeast, experienced below normal temperatures.

By mid-month, the pattern which was to persist the remainder of the month was firmly established, with the western portion of the Nation below normal in temperature, and the eastern half above normal. The line separating the two temperature regions moved slowly southeastward until by the last week of October the dividing line ran from the North Dakota-Minnesota border southward into southwestern Texas. At mid-month, temperature departures were generally small, averaging 2° to 3° above normal over the eastern two-thirds of the Nation.

With the cool air to the Northwest, several surges of cold air worked their way southward. McComb, Mississippi, reported 39° on the 11th, and Tallahassee reported 42° on the 12th.

Around October 20, a large low pressure system moved from northeastern Colorado to Manitoba, bringing cold air whistling southward west of the system. Temperatures were in the seventies and eighties to the east of that same system over the central Great Plains. The remainder of the Nation east of the low pressure system averaged 3° to 6° above normal.

During the last week of the month, the eastern half of the Nation averaged 6° to 15° above normal in a final flurry at Indian Summer. Meanwhile, the western half of the U.S. averaged 6° to 18° below normal, accompanied by high winds and snow over the Rockies. A sharp temperature contrast existed across a cold front which was present along the Nebraska-Kansas border on the 28th. That afternoon, Lincoln, Nebraska, in the cold air, reported 44° while Topeka, Kansas, recorded 81°. Temperatures plunged to -15° at Big Piney, Wyoming, on the 30th.

The extended Indian Summer over the eastern half of the Nation resulted in many new records being set at a number of locations. On October 30, record highs were reported at Rochester, New York (80°), Buffalo, N. Y. (73°), Lexington, Ky. (83°), Bristol, Tenn. (79°), Madison, Wisc. (78°), and Lansing, Mich. (tied 77°) to name a few. In Philadelphia this was the second warmest October in 101 years of record, surpassed only by 1947. This was the warmest October ever at the Nation's Capital with an average temperature of 64.7°.

Flagstaff, Ariz., set fourteen records during October. It was the coldest October in 73 years of record with an average of 38.6°. A -2° reading on October 30 was the coldest ever in October.

PRECIPITATION--Most of the Nation received above normal precipitation during the month, except for the area west of the Rockies, and an area extending from Michigan to the Gulf between the Mississippi and the eastern mountains.

The month began with rains from meandering Hurricane Ginger soaking portions of the Eastern Seaboard, and a system over the northern Great Plains blanketing portions of the Rockies with wet snow. The western snows were followed by a week of no precipitation over the western one-third of the Nation. However, generous rains fell over most of the Eastern Seaboard. Heavy showers fell from the Lower Rio Grande Valley and moved northeastward to the Middle Atlantic coast on the 4th and 5th. In the 24 hours ending at midnight of the 5th, Cotulla, Tex., received 6.09 inches of rain.

At midmonth heavy snows again belted parts of the West, while torrential tropical rains fell in the Florida Keys. A low pressure system southwest of the Florida coast drenched southern Florida. Over 8.50 inches of rain fell at International Airport, Key West, in the 48-hour period ending the morning of the 13th. On the 15th and 16th snow fell in western Montana and spread over a wide area. The storm, centered over the Great Basin, dumped 20 inches of snow at Austin, Nevada, on the 16th and on the 17th and 18th, 11 inches fell at Flagstaff, Ariz. This was the heaviest October snowstorm in more than half a century at Flagstaff, Ariz.

Heavy snows were again a topic of conversation as the month came to a close. By the 29th, 17 inches of snow had accumulated at Lander, Wyo., with 10- to 12-inch accumulations at several reporting stations. Rawlins, Wyo., reported an accumulation of 21 inches. On the 31st, a record 24-hour snow of 8.50 inches set a new record at Salt Lake. This also gave Salt Lake its snowiest October on record, with almost 17 inches (16.6) for the month.

Meanwhile, over the eastern half of the Nation, early morning fog was a common occurrence. Soaking rains fell over the Atlantic Coastal States from southern New England to Georgia, in a continuing pattern of weekend rains, on the afternoon of the 25th.

The central portion of the Corn Belt, and on over through the Rockies, received above normal rainfall, helping to replenish depleted soil moisture in some areas. The area between the Mississippi River and the western mountains received below normal rainfall, with most of southern Alabama and Mississippi re-

ceiving less than 0.75 inches of rain during the entire month. Jackson, Miss., received a total of 0.09 inches of rain, or about one-twentieth of the normal.

Portions of the Eastern Seaboard received large amounts of rainfall. Most of Virginia and the Carolinas received over twice the normal rainfall for October. Rainfall amounts exceeding 10 inches were reported at several locations.

Totals over the northern Great Plains ranged from 200 percent to more than 400 percent of normal. Williston, N. Dak., received 3.56 inches, the largest October total in the 92-year record. It was the second wettest October in 97 years at Bismarck, N. Dak., where 3.74 inches of rain fell. And Minneapolis, Minn., with 5.68 inches, was the wettest in 60 years. Lander, Wyo., established a new October snowfall record with a total of 39.9 inches. Flagstaff, Ariz., received 24.7 inches of snow. This is the most snow that fell in October in the past 73 years.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70°F. or obove for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevation [illegible]

Data from airport unless otherwise specified U indicates Urban, R indicates Rural, sites

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month

Wind directions under resultant direction are in tens of degrees

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees Those stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1 C or above for Alaskan Stations
Y Peak Gust
And also on an earlier date or dates
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication

Data in this table are obtained by conversion from data in the English Units table

Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

OCTOBER 1971

Elmer R. Nelson, Office of Hydrology

Severe flooding occurred along some small streams, tributaries, and the main stem of the Appomattox River in Virginia during October. The flooding along the Appomattox River was rated as a 20-yr. flood at Farmville and as a 40-yr. flood at Mattoax, Va.

Extensive flash flooding occurred at San Diego, Tex., and downstream on San Diego Creek during mid-October. Alice, Tex., was nearly isolated by the high water. Heavy flooding occurred on tributaries of the lower Nueces and major flooding on the extreme lower Nueces.

HUDSON BAY DRAINAGE

Red River of the North Basin - Rainfall amounts in the Red River of the North Basin, during October, ranged from 1 to 4 inches above normal. The heavy rains on the 16th-19th produced heavy runoff. Several tributaries along the lower right bank reached one-half bankfull but all points remained well below flood stage. The above normal rainfall left the soil extremely wet by the end of the month.

ATLANTIC SLOPE DRAINAGE

Heavy rains on the 9th-10th over southeastern Pennsylvania and New Jersey caused moderate rises on streams to or near bankfull stage. Brandywine Creek, near Chadds Ford, Pa., reached bankfull stage shortly after midnight on the 11th. Some minor overflow of small streams was reported in the Philadelphia, Pa., area. The Schuylkill River at Philadelphia and Perkiomen Creek near Graterford, Pa., crested about 2 feet below flood stage.

All reservoirs in New Jersey remained unusually full for this season of the year. Jersey City and Newark reservoir systems were both spilling at the end of October, while Hackensack Water Company's reservoirs were at 96 percent of capacity, Wanaque, 89 percent, and Spruce Run at 71 percent of capacity. New York City's three reservoirs on the upper Delaware Basin showed a decrease in storage of 39 billion gallons during October and at month's end were at 47 percent of capacity.

Minor flooding occurred in the lower James River Basin in Virginia on the 24th-27th. The crest stages on the 25th-26th ranged from 1.5 to 2.5 feet above flood stage except at Richmond's City Locks gage where it was 0.3 foot above flood stage. This flooding was due to heavy rains on the 23d to the 26th ranging from 2 inches in the upper basin to around 4-1/4 inches in the lower basin. Damages were light.

Widespread flooding, some serious, was reported along small streams, tributaries, and the main stem of the Appomattox River in Virginia on the 23d-27th. The U.S. Geological Survey reported that the Appomattox River at Farmville, Va., rose to a stage of around 21 feet and was rated as a 20-yr. flood. At Mattoax, the river reached a level of 32.5 feet and was rated as a 40-yr. flood. These stages were exceeded only by the 1940 flood. The stage at Deep Creek was 19.53 feet or about 12.5 above bankfull stage. It exceeded the 1940 stage of 14.8 feet by 4.7 feet. Buffalo Creek rose to a stage of 12 feet or 7 feet above bankfull stage. This flooding was due to heavy rains (6 to 8 inches) on the 23d-26th. Extensive damage resulted to the peanut crop. One man was electrocuted while attempting to pump water from his house.

There were several periods of flooding on streams in eastern North Carolina during October. The first rise was due to heavy rains associated with Hurricane Ginger. The precipitation ranged from 4 to 8 inches over the lower Roanoke, Tar, and Neuse Basins, and 2 to 3 inches in the headwater areas of the Tar, Neuse, and Cape Fear Rivers. The upper Roanoke Basin averaged around 1 inch with 2 to 3 inches locally. This rain caused the streams to rise moderately and minor overflow began on the Neuse and Cape Fear Rivers on the 3d. Before the rivers had a chance to subside, a line of showers and thundershowers broke out over the mountains and spread eastward causing significant amounts of precipitation across the State. Rainfall averaged 1 to 2 inches over the upper portions of the Cape Fear, Neuse, and Tar Rivers. This rain prolonged the high stages and the minor overflow along the Neuse and Cape Fear Rivers. Additional rainfall amounts of 1 to 2 inches on the 10th produced moderate rises but no additional overflow to that already in progress in the upper Neuse and lower Cape Fear River Basins. Heavy rain between the 16th and 25th caused the Roanoke River to rise 5 feet over its banks at Randolph, Va., and slightly over bankfull at Roanoke, Va., and in the Williamston, N. C., area. Some minor overflow continued on the Neuse River. Moderate rain continued in eastern North Carolina on the 26th causing some of the rain-swollen rivers to rise to the highest levels observed in recent years. Minor overflow continued on the Neuse, Tar, and Roanoke Rivers at the close of the month. Although no damage was reported, investigation into its possibility is being made.

Hurricane Ginger crossed the south coast of North Carolina and moved inland as a tropical storm on October 1. The resulting rainfall on the 1st-2d totalled mostly 2 to 3 inches over southern North Carolina and northern South Carolina. Cheraw, S. C., received 4.32 inches in one 24-hour period. The Lumber River at Lumberton, N. C., rose above flood stage and continued above flood stage the remainder of the month due to additional rainfall. The highest crest reported was 10.2 feet, 1.2 feet above flood stage, on the 4th and 29th. One to 2 inches of rainfall on the 9th-10th followed by 2.5 to 9.25 inches on the 15th-16th caused flooding on the Rocky River at Norwood, N.C., and the Pee Dee and Broad Rivers in South Carolina. The flash flooding resulted from the excessive rainfall during the night of the 15th and early morning of the 16th was severe and caused heavy material damage. The total damage in Cleveland and Gaston Counties in North Carolina was estimated at $262,000. People were evacuated from a few houses in Shelby, N. C., and from 30 mobile homes in Gastonia, N. C. Major damage occurred to rural highways due to road and bridge washouts. Heavy damage occurred in Cherokee and York Counties in South Carolina. Major road damage occurred along Kings Creek. Road crews were out all night barricading roads that were washed out and that had damaged bridges. Some bridges were flooded by 4 feet of water. The 4 to 9.25 inches of rain that occurred in less than 12 hours demolished many retaining walls and flooded many basements. Rainfall ranging from 3 to 6 inches on the 20th-25th and 1 to 3 inches on the 31st caused flooding on the Yadkin River in North Carolina and on several streams in South Carolina.

MISSISSIPPI SYSTEM

Missouri Basin - The only flooding in the Missouri Basin during October was on the Marmaton River near Fort Scott, Kans., on the 21st. This minor overflow was due to 2 to 4 inches of locally heavy rain on

the 20th.

Arkansas Basin - The flooding in the Arkansas Basin during October was due to locally heavy rains. More than 6 inches of rain occurred in the Fourche Maline Basin on the 16th. Heavy rains occurred over a portion of northeastern Oklahoma on the 20th-21st where excessive rains occurred the previous month. Precipitation averaged 3 inches over Pole Cat Creek and in the Neosho Basin above Commerce, Okla., and 5 inches over Caney River and Bird Creek. The Fourche Maline River in east-central Oklahoma reached its highest stage since October 1970. Minor overflows occurred on Mingo and Joe Creeks in Tulsa, Okla. Much of the flooding occurred in rural lowlands so damages were minor except moderate on Bird and Pole Creeks.

Red Basin - Heavy thunderstorms during the night of the 19th-20th caused minor flooding in northeastern Texas and southeastern Oklahoma. Beaver Creek near Electra, Tex., crested 0.8 foot above flood stage on the morning of the 20th. The Sulphur River continued above flood stage at Hagansport, Tex., on the 19th-25th and at Naples, Tex., from October 23 to November 2. The highest crest occurred at Naples, Tex., where it crested 7.7 feet above flood stage on the 26th. The Blue River at Blue, Okla., crested 2 feet above flood stage on the 21st.

WEST GULF OF MEXICO DRAINAGE

Minor flooding occurred in northeastern Texas on Lake Fork Creek on the 22d-23d and on the upper Sabine River between October 2 and November 4. The crests on the Sabine River ranged from 2.3 feet above flood stage at Emory, Tex., on the 21st to 3.5 feet above flood stage at Mineola, Tex., on the 24th. Cattle along the Sabine River were moved to higher ground.

Flash floods in north-central Texas during October caused the loss of four lives and property damage estimated at $150,000 to $200,000. Flash flooding affected many residences that had escaped flooding during similar downpours in previous years. Flash flooding occurred along White Rock Creek on the 3d and in portions of Tarrant, Johnson, and Dallas Counties on the 19th. In Johnson County minor flooding occurred along east and west Buffalo Creeks in Cleburne, Tex. In Dallas, flash flooding closed streets and snarled traffic, but few structures, if any were affected.

The East Fork of the Trinity River overflowed near Crandall, Tex., on the 20th-22d. It crested 3.1 feet above flood stage on the 20th. Minor overflow occurred on Elm Fork at Carrollton, Tex., on the 19th-20th and on Chambers Creek near Corsicana, Tex., on the 21st-23d. The Trinity River overflowed in the Roosevelt Height section in the south portion of Dallas, Tex., on the 19th-22d. This area is unprotected by a levee system. Water rose a few inches into several homes according to Civil Defense. From Dallas to Rosser, the main stem of the Trinity was 6 feet or more above flood stage. Floodwaters moved downstream below Rosser, with flood stage being reached at Trinidad on the 21st and at Long Lake, Tex., on the 26th. The Trinity was back within its banks at all points by November 1. Damages along the Trinity River were estimated at $896,000 by the Corps of Engineers.

Locally heavy rains caused minor flooding on the Navidad River near Ganado, Tex., on the 20th. The heaviest rainfall reported was 5.55 inches. No damage was reported.

Intermittent heavy rains from the 3d to the 9th caused flooding in the Nueces Basin below Crystal City, Tex. Rainfall accumulations reached 5 to 6.5 inches near Cotulla, Tex., and 3 to 4 inches elsewhere along the middle Nueces. Brief minor flooding occurred on the 4th and on the upper Frio, the extreme upper Nueces, and tributary streams above Uvalde, Tex., and Turkey Creek. Precipitation in this area averaged about 1 inch above Crystal City, Tex., and 1 to 2 inches along the extreme upper Nueces above Uvalde, Tex., and Turkey Creek. Near simultaneous rises occurred along the middle Frio, the lower Atascosa, and the middle Nueces with minor flooding. Lake Corpus Christi was full before the rains, and water from upstream flowed through unretarded to crests at Mathis on the 13th and Calallen, Tex., on the 14th with extensive flooding along the extreme lower Nueces. Heavy rains on the 16th caused brief flash flooding of some streets and homes in Corpus Christi near midday. Heavy rains ranging from 15 to 20 inches near Clegg, Tex., during the night of the 16th caused extensive flash flooding at San Diego, Tex. Two hundred families were flooded out of their homes and one drowning was reported. Extensive flooding moved downstream on San Diego Creek, nearly isolating Alice, Tex., on the 17th. Heavy flooding occurred on Spring and Ramirena Creeks, tributaries to the lower Nueces, south of George West. Considerable damage resulted to roads and a railroad, including bridge washouts. U. S. Highway 281 was closed south of George West for about one week. The water ran through Lake Corpus Christi causing major flooding on the extreme lower Nueces. Sharp crests occurred at Mathis on the 18th and at Calallen on the 19th. New rises began on the Nueces near Tilden, Tex., on the 18th and near Three Rivers, Tex., on the 19th with extensive flooding on the 21st. This water caused another rise with extensive flooding below Lake Corpus Christi beginning on the 21st and 22d. Heavy rains of 2 to 4 inches on the 19th-20th caused considerable flooding on the lower Frio for several days beginning on the 20th.

Minor flooding occurred on the Rio Grande at Presidio, Tex., on the 8th. This flooding was due to heavy rains on the 4th-8th ranging from 2.5 to near 5 inches. Heavier amounts apparently fell in the adjacent areas of Chihuahua, Mex. An airplane pilot observed that much of the river was out of its banks for at least 50 miles northwest of Presideo, Tex. Mexican Army pilots indicated that much of the desert of Chihuahua next to the Rio Grande was like a lake. The low sections of the road leading from Presidio to the Big Bend National Park were temporarily closed due to the high water. No damage was reported.

GULF OF CALIFORNIA DRAINAGE

Colorado Basin - Flooding continued on the Little Colorado River in northeastern Arizona from September 29 to October 1. The damage from the flooding was estimated at $1.4 million.

Heavy rains of up to 3 inches on the 24th in the headwaters of the San Francisco and Gila Rivers in Arizona and New Mexico resulted in minor flooding from the 25th through the 27th. The damage was estimated at less than $5,000.

PUERTO RICO

Heavy showers caused some minor flooding, interrupting field operations and traffic in the San Juan, Arecibo, Aguadilla, and Mayaguez districts on the 12th, 14th, and 15th. The heaviest showers occurred in the northwest

area around Coloso where 8.08 inches were recorded for the week ending October 15. Of this total, 3.18 inches of precipitation occurred on the 11th.

Some local flooding occurred in Mayaguez on the 26th when the Yaguez River overflowed its banks. The Quintana and the Arturo Gigante streets of the Balboa section and the Morel Campos and the Concordia streets of the Playa section were flooded. Some 40 persons, including children, were left homeless and had to be moved to safe shelter. The Rexach Construction Co., now channelizing the river, lost thousands of dollars in equipment that was being used near the river. There was no loss of life, but unofficial estimates by the Civil Defense estimated the damage near $250,000.

floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.c.t.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1937 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter.
Values with an asterisk are interpolated.

† Indicates urban sites

The solar radiation data in this table form the basis for the analyses in Charts VII, A, and B, of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m. at Palmer, Alaska

OCTOBER 1971

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	- 17	6	37	- 56	- 53	- 33	- 44	- 34	- 34	- 31	- 39	- 49	- 76	- 1	- 26	-	- 12	- 61	- 80	- 78	- 69	- 22	- 71	-118	- 89	- 32	- 5	- 74	- 90	- 35	-111	- 45

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .													NO DATA - MACHINE MALFUNCTION																			

These data are from an U - V Eppley total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code A S Q Q Q defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

The spectrophotometer measures the total amount of ozone in the atmosphere, i e, the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Q Q Q) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g, 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code A S designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), October

B. Temperature Departure from 30 - Year Mean (°F 1931-60), October 1971.

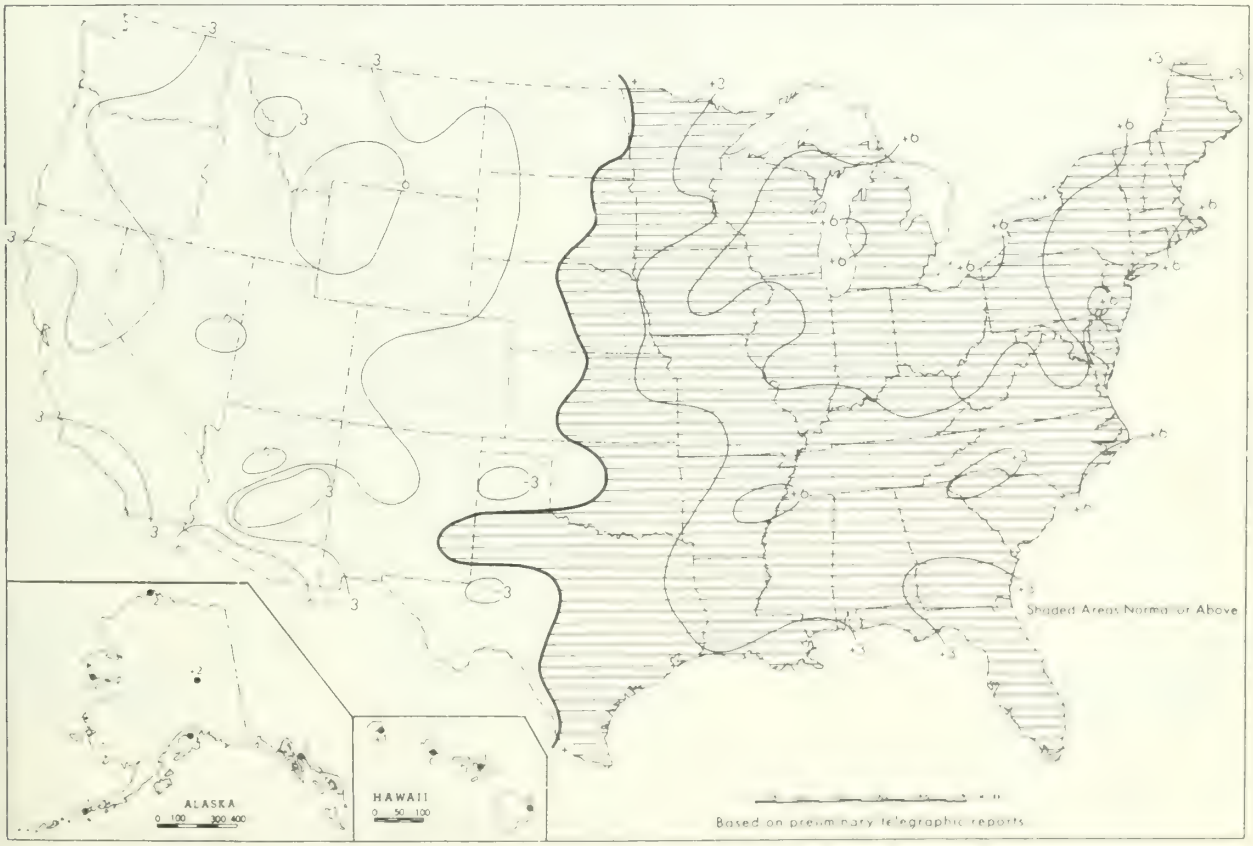

Chart II. Total Precipitation (Inches), October 1971.

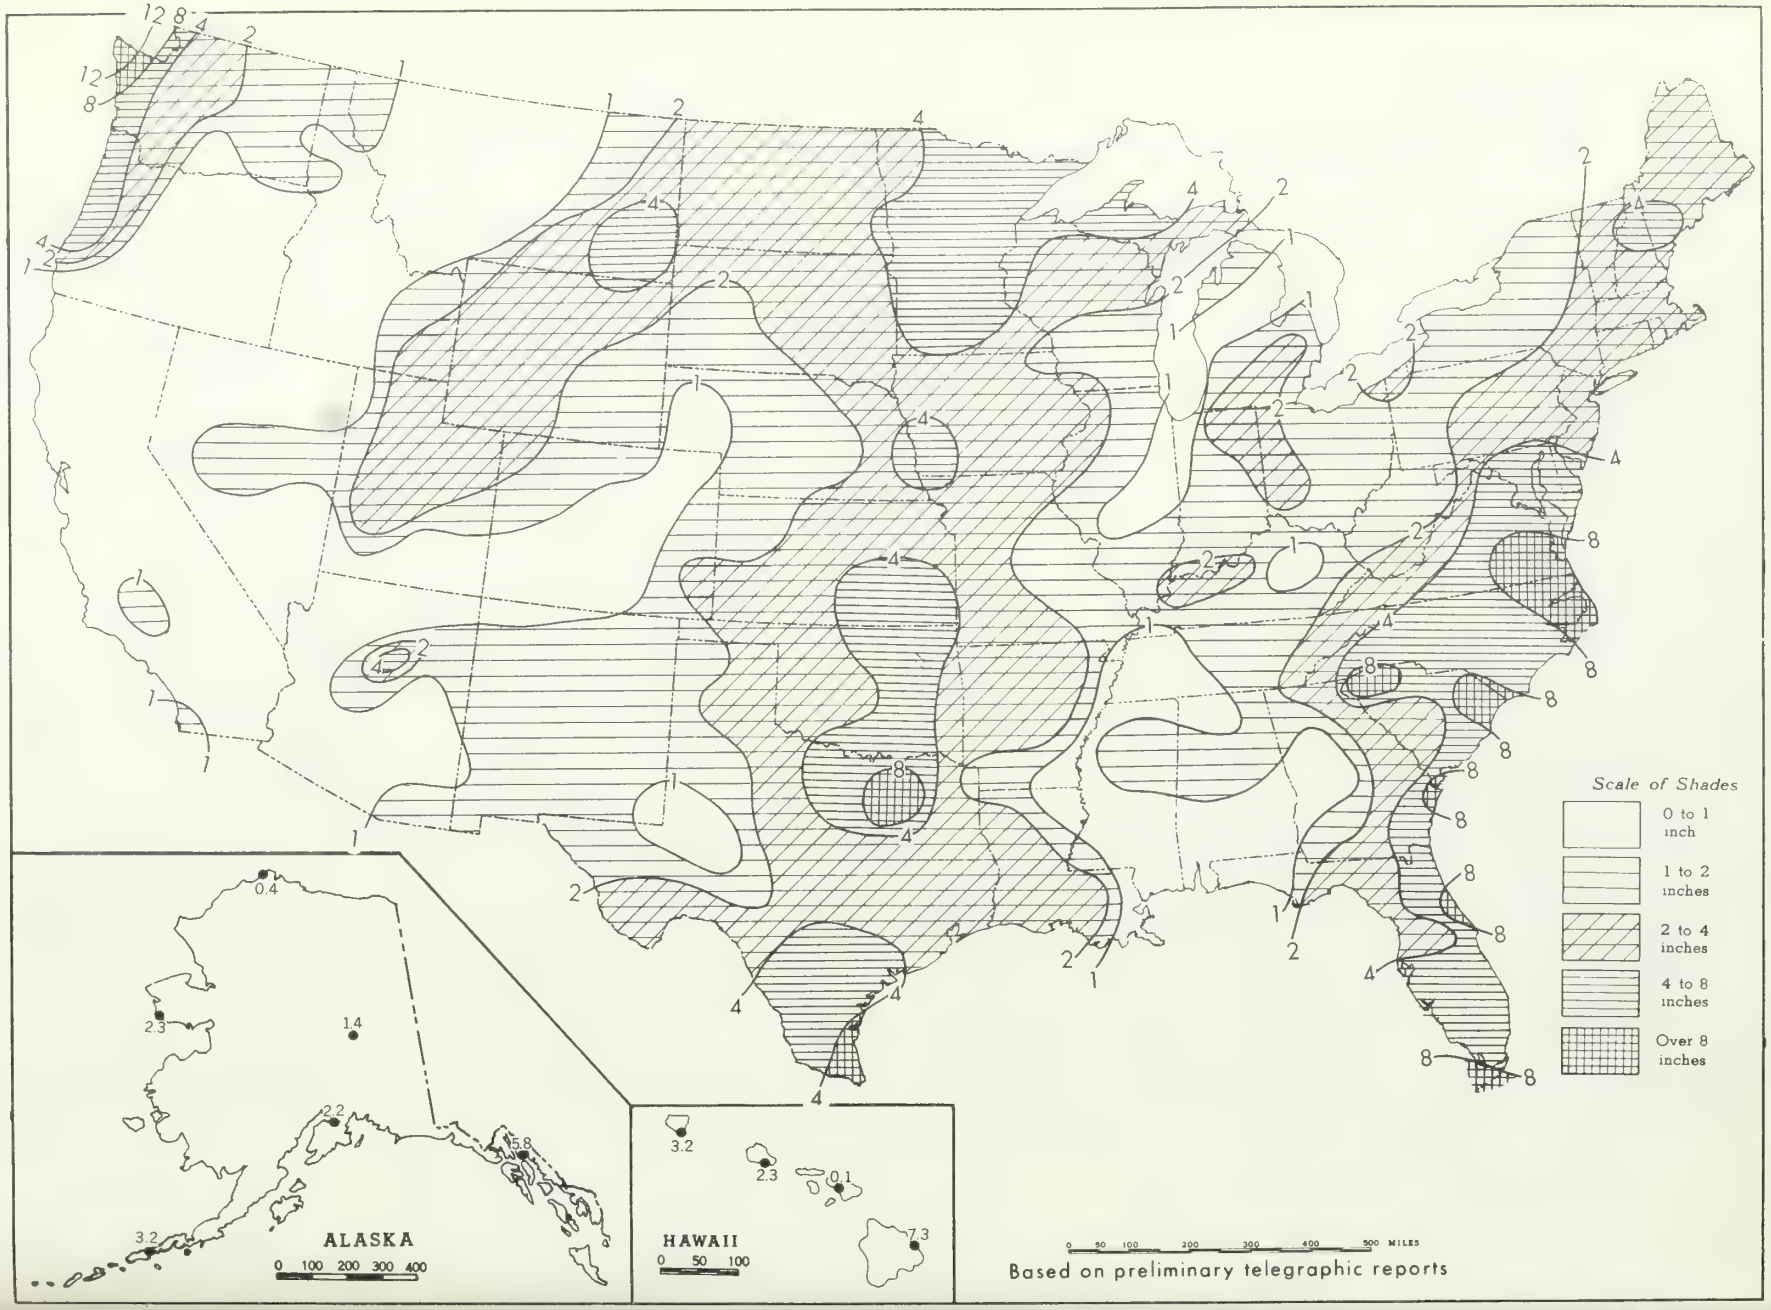

Chart III. Percentage of Normal Precipitation, October 1971.

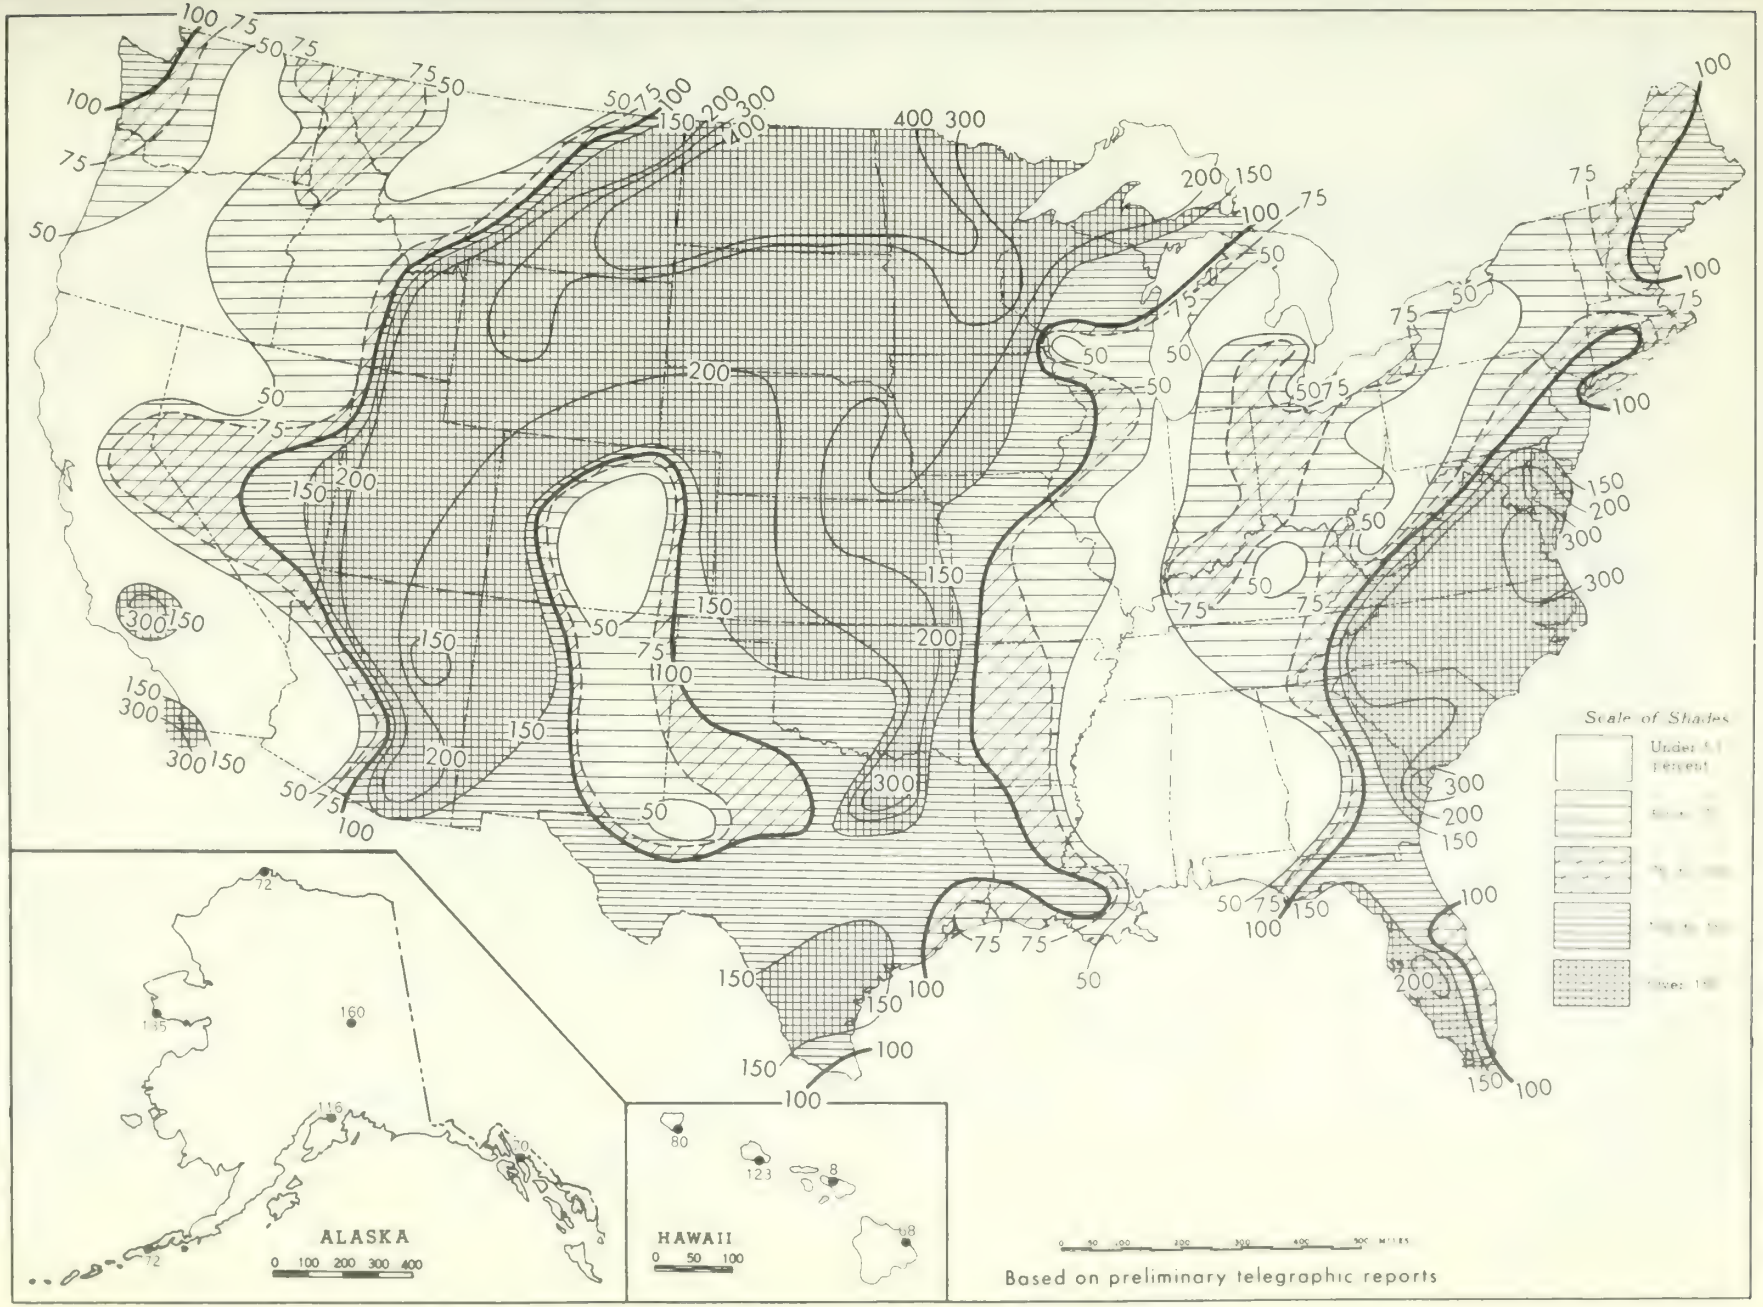

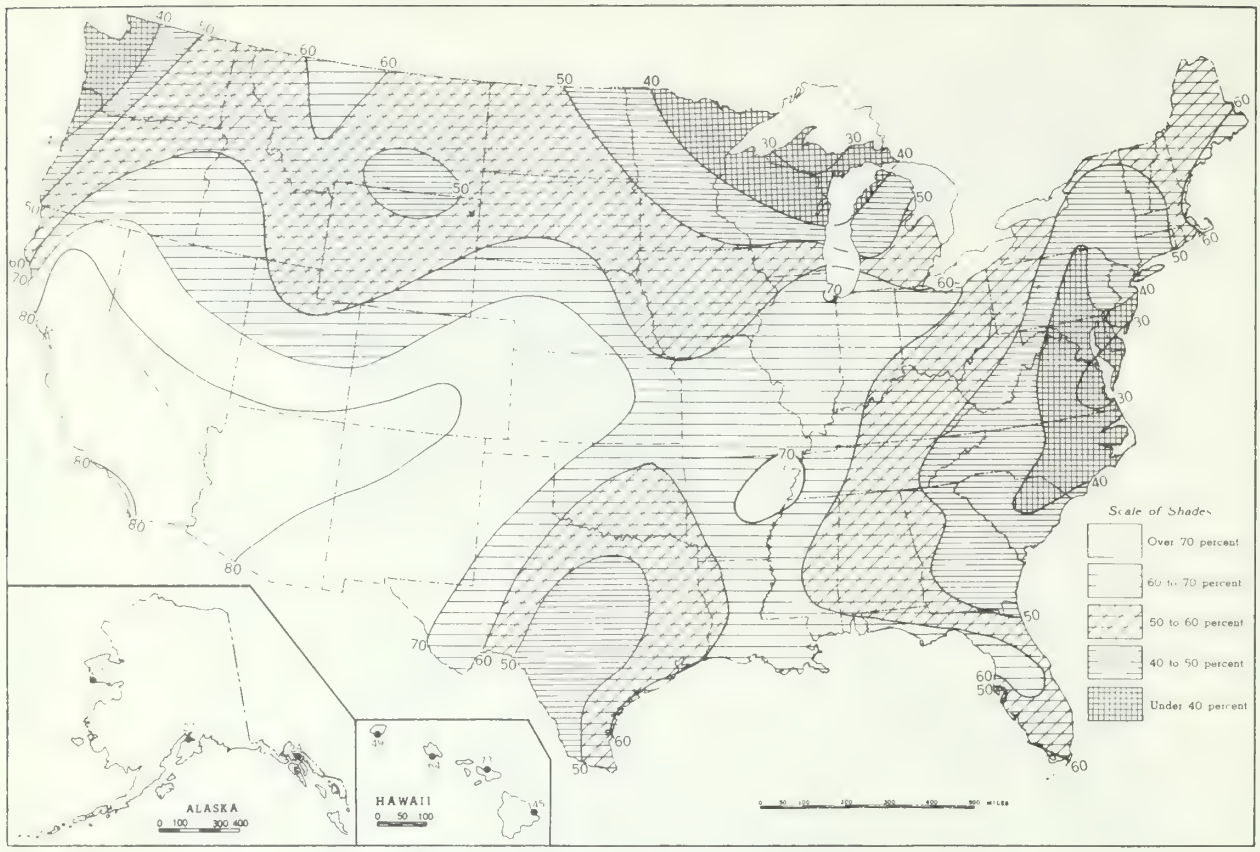

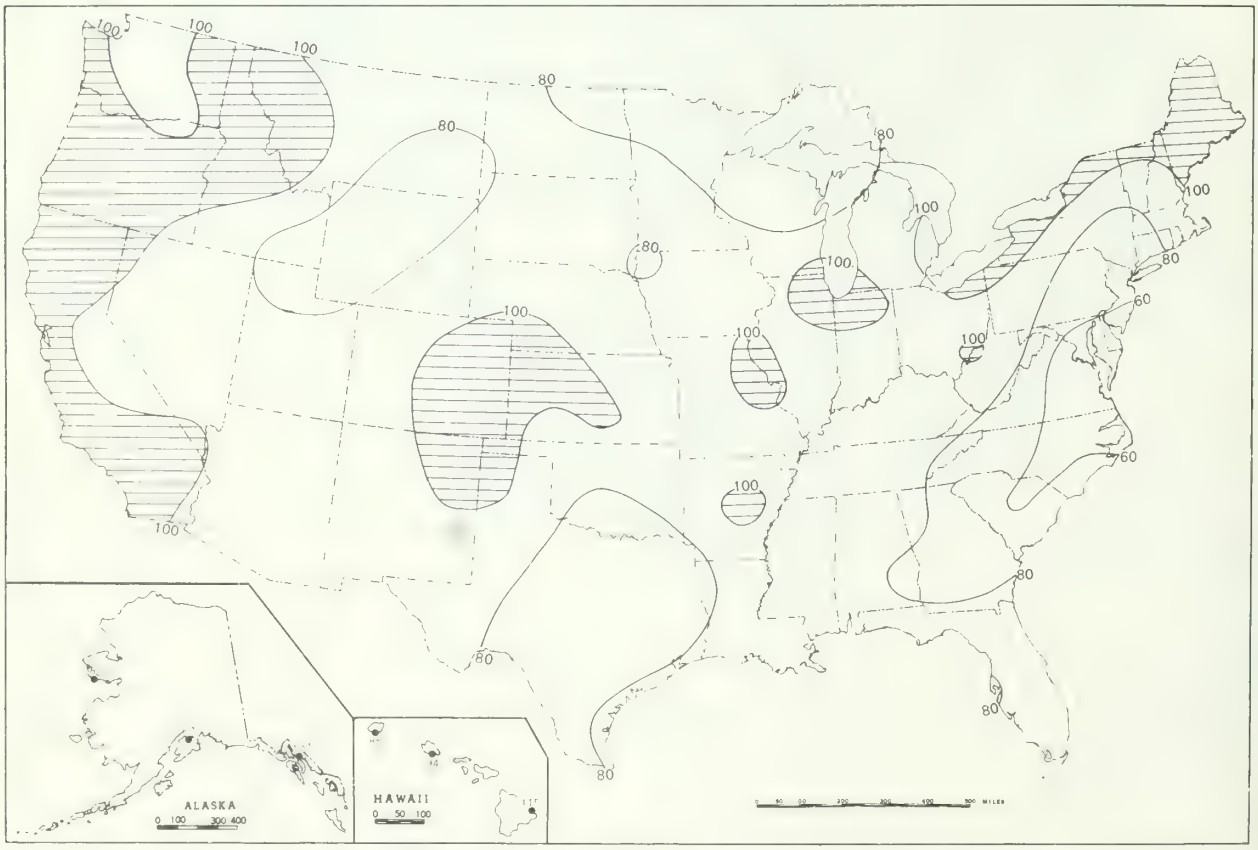

Chart VI. A. Percentage of Possible Sunshine, October 1971.

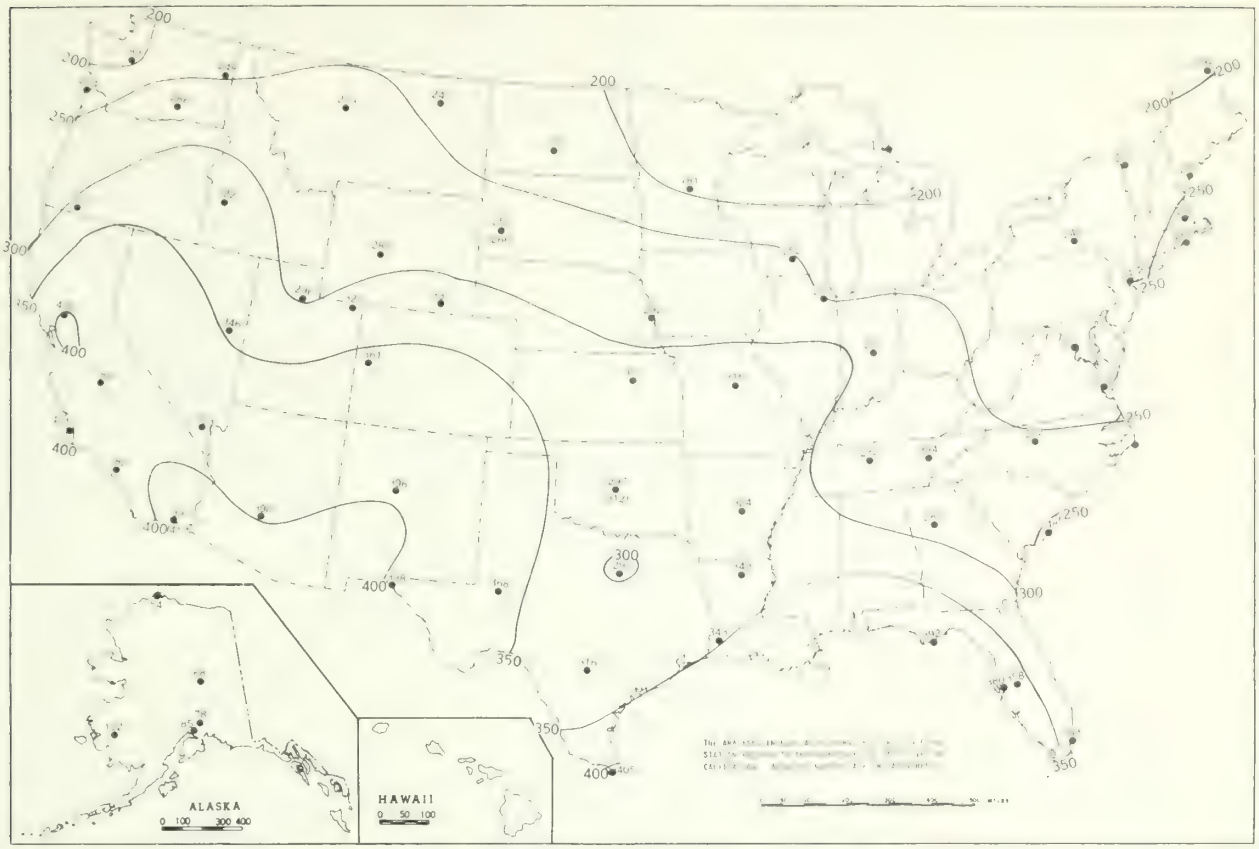
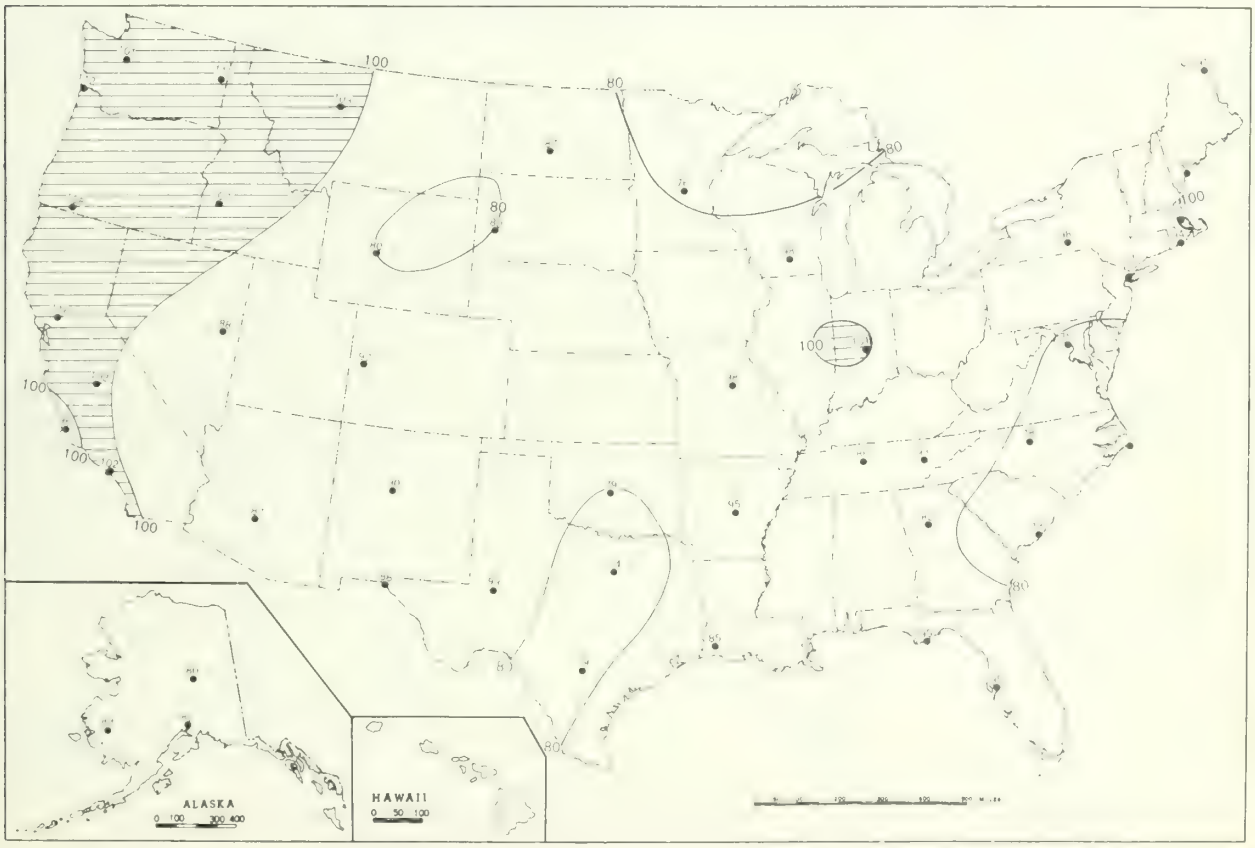
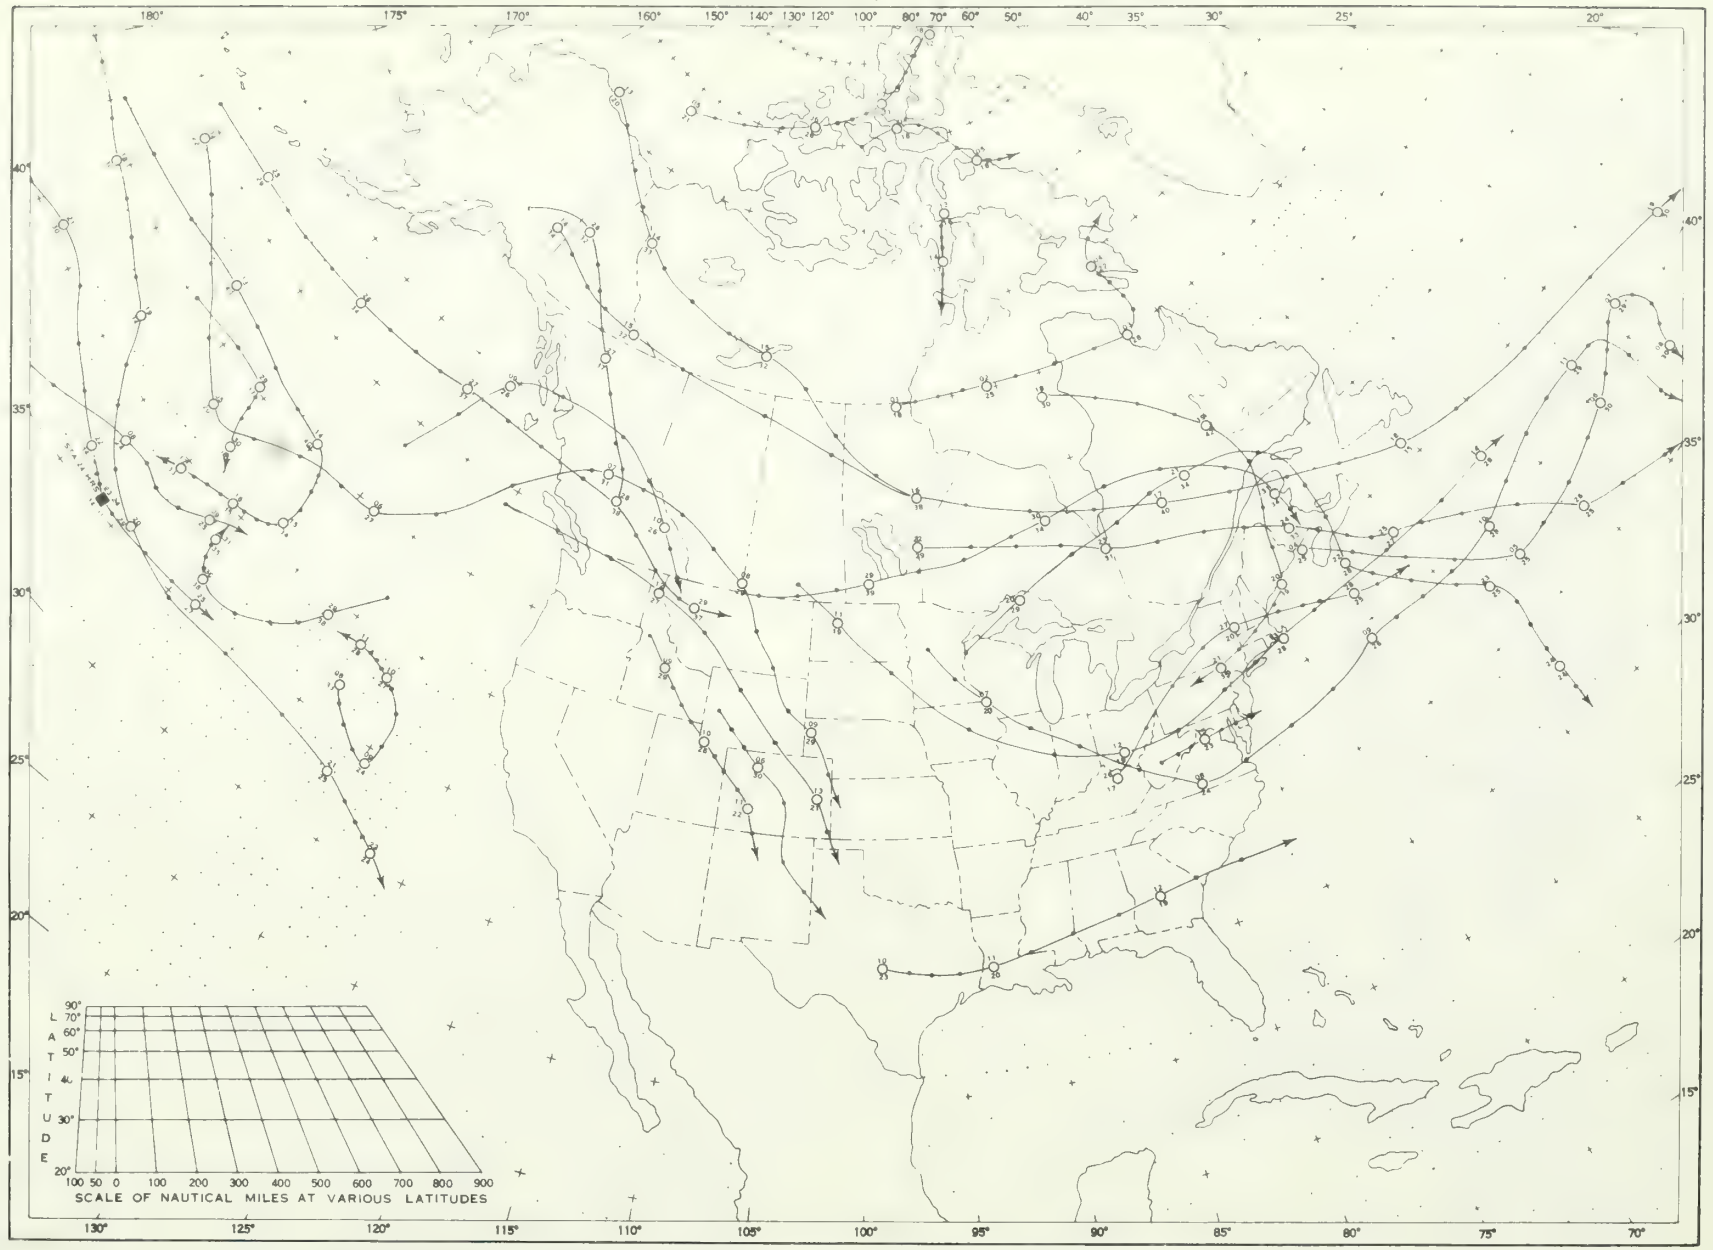


B. Percentage of Mean Monthly Sunshine, October 1971.

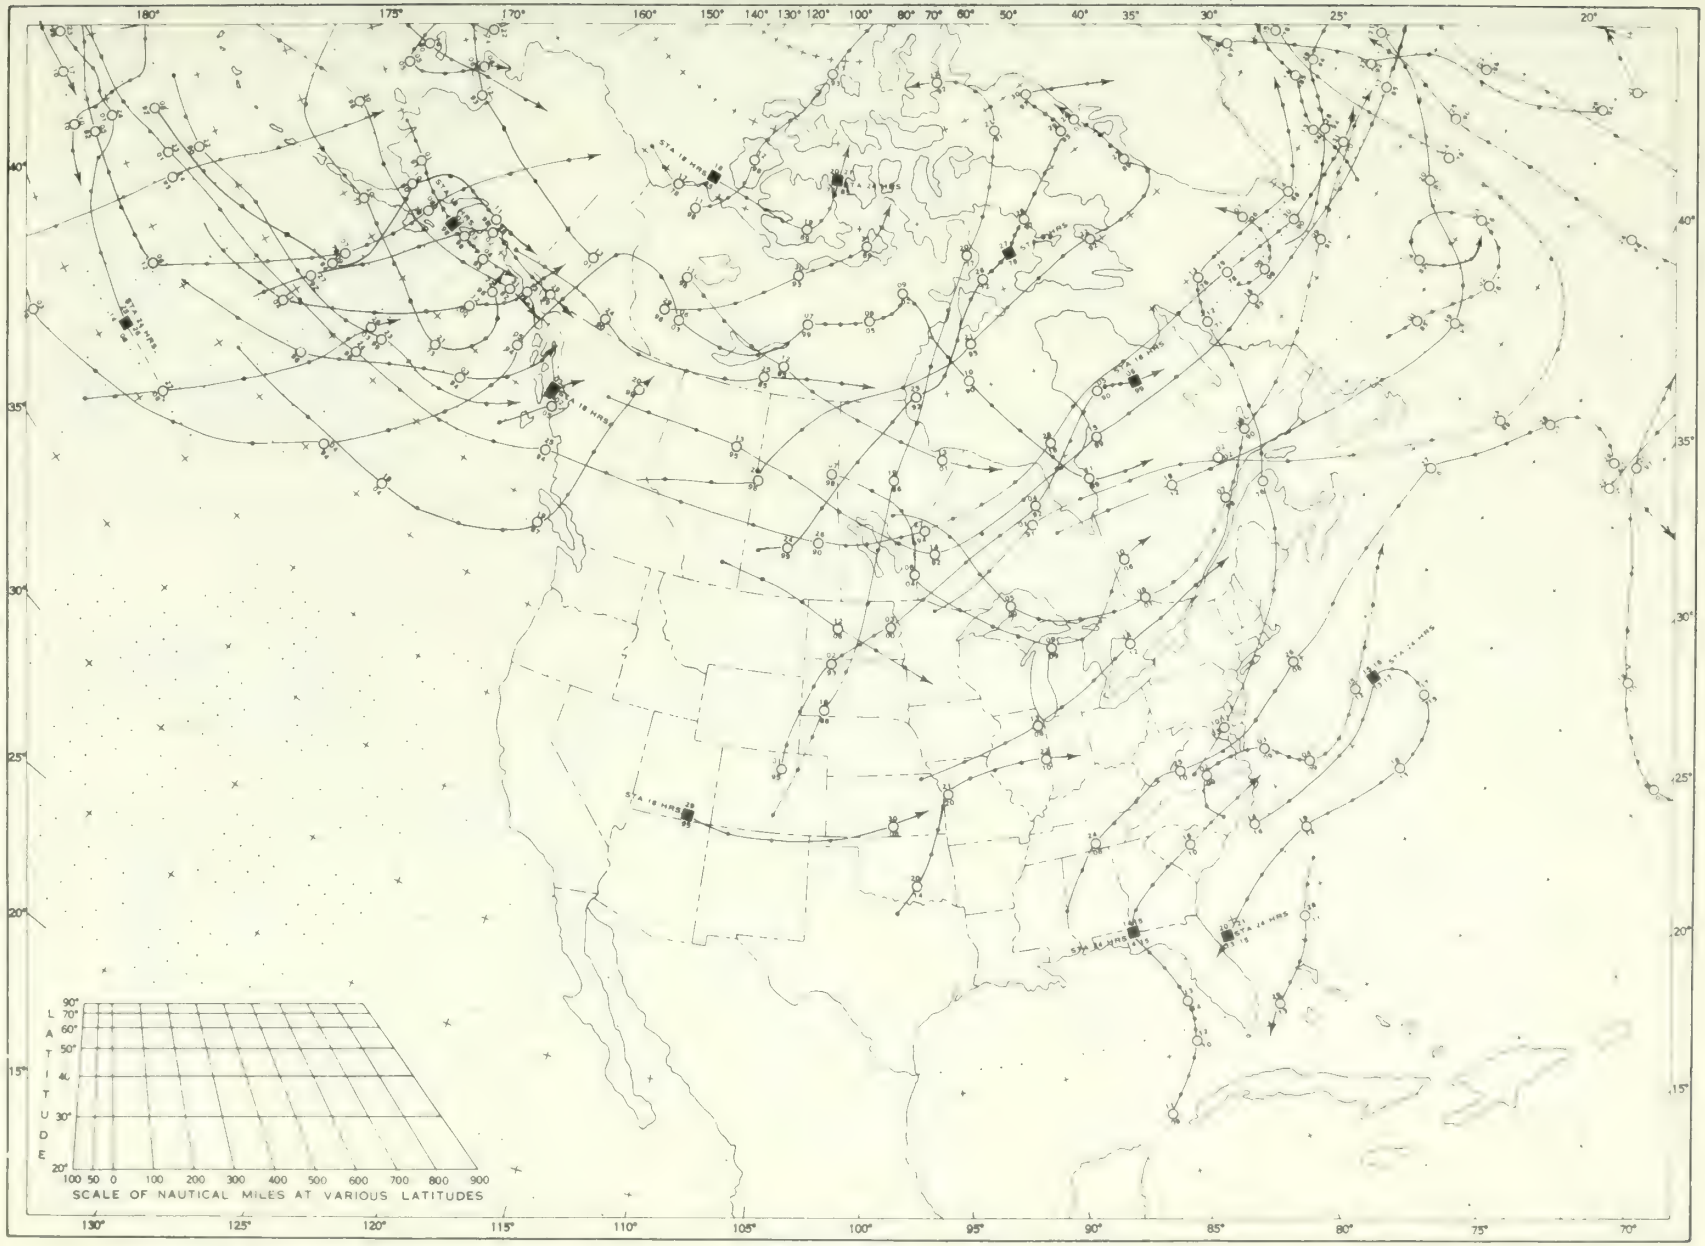


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, October 1971.

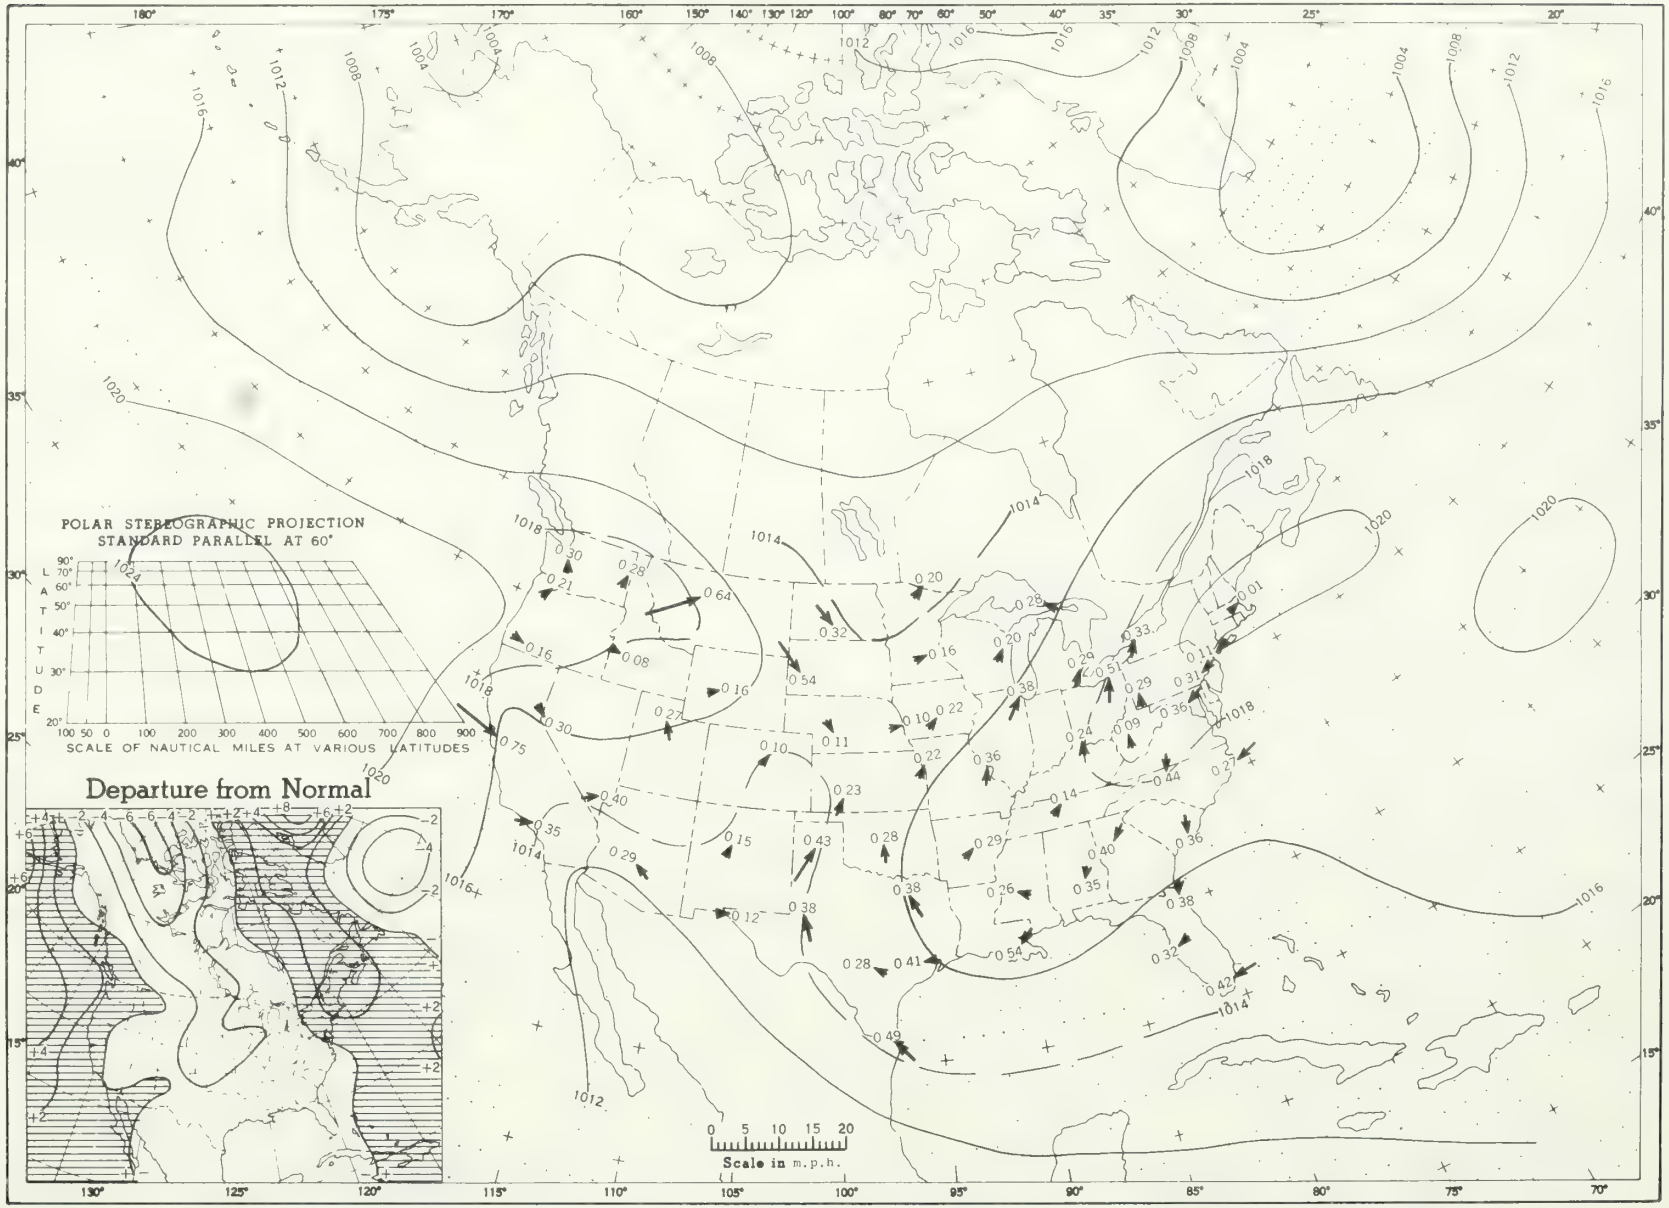


B. Percentage of Mean Daily Solar Radiation, October 1971.



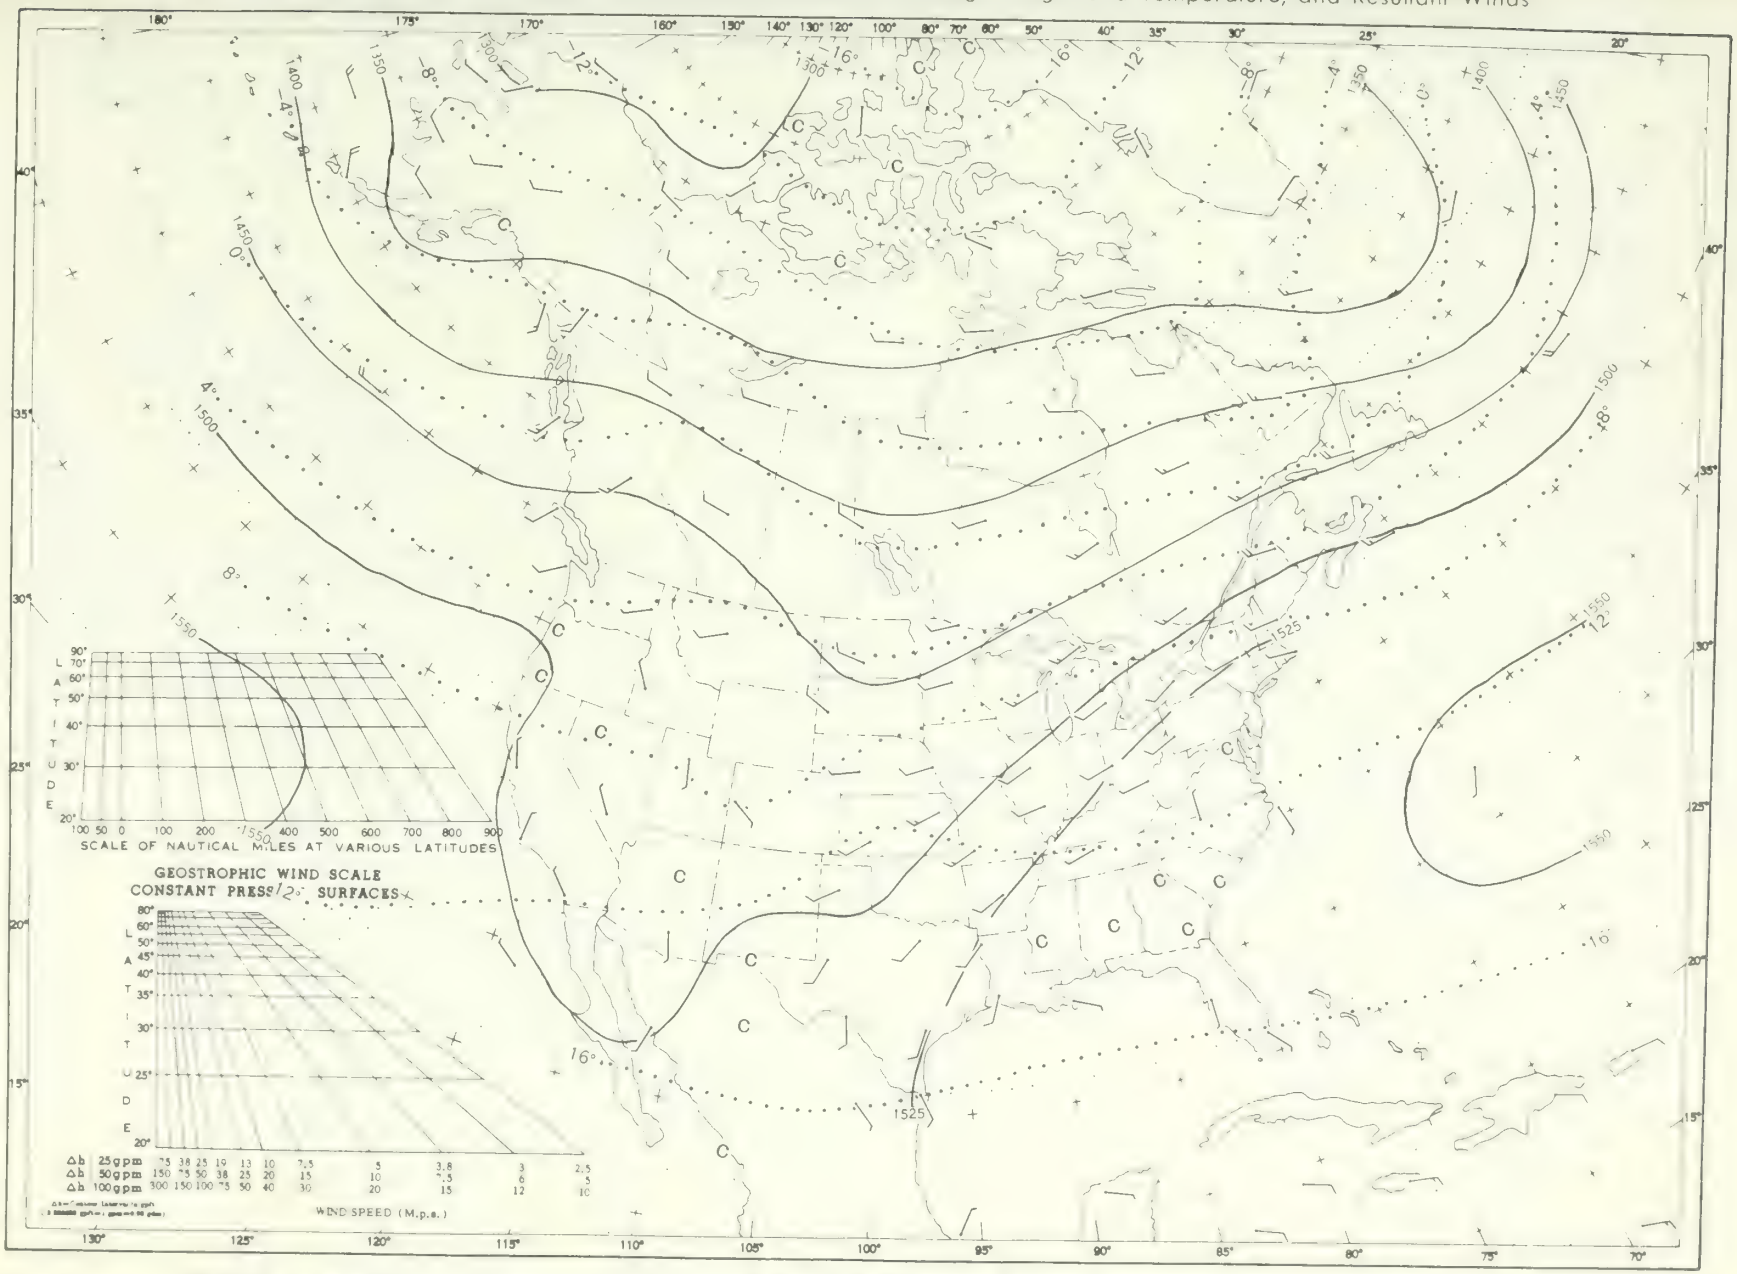
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, October 1971.



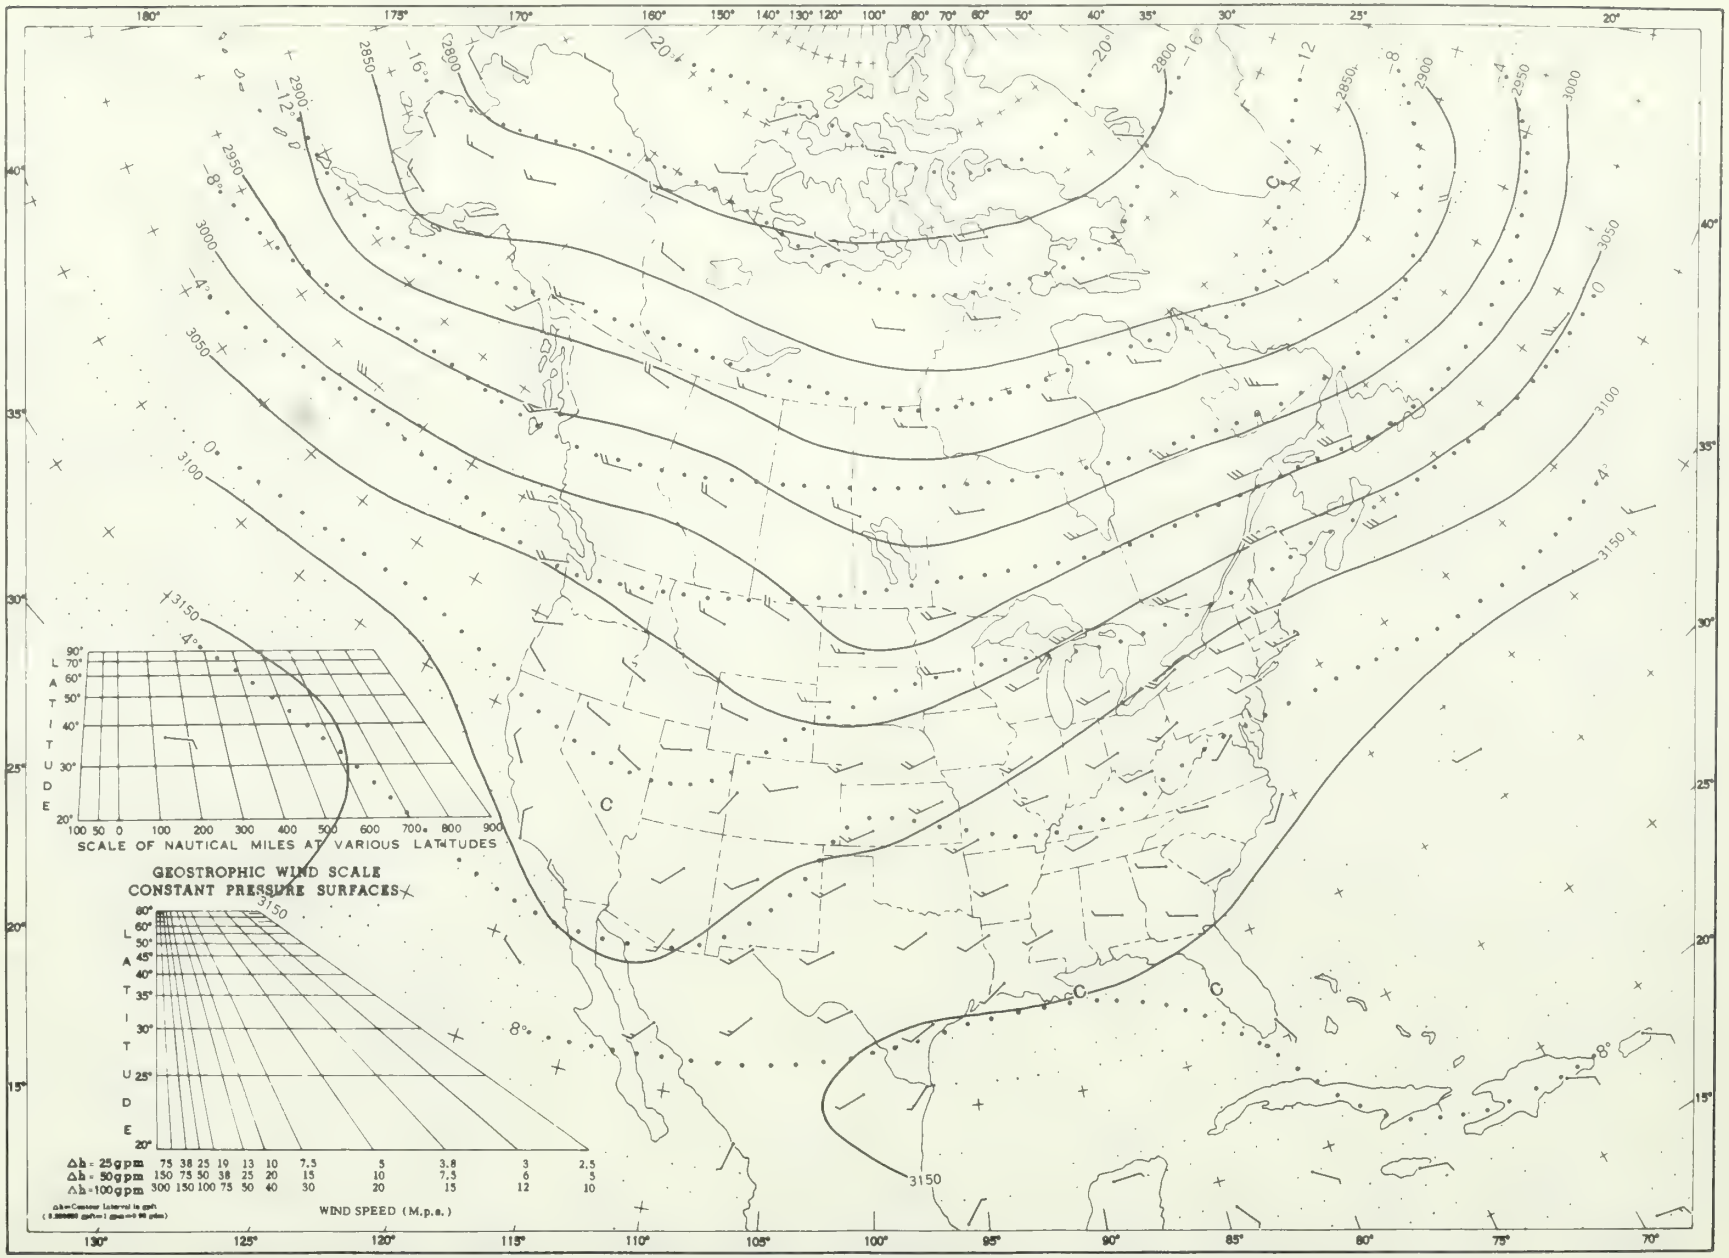
Circle indicates position of center at 7:00 a.m. **e.s.t.** Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, October 1971.



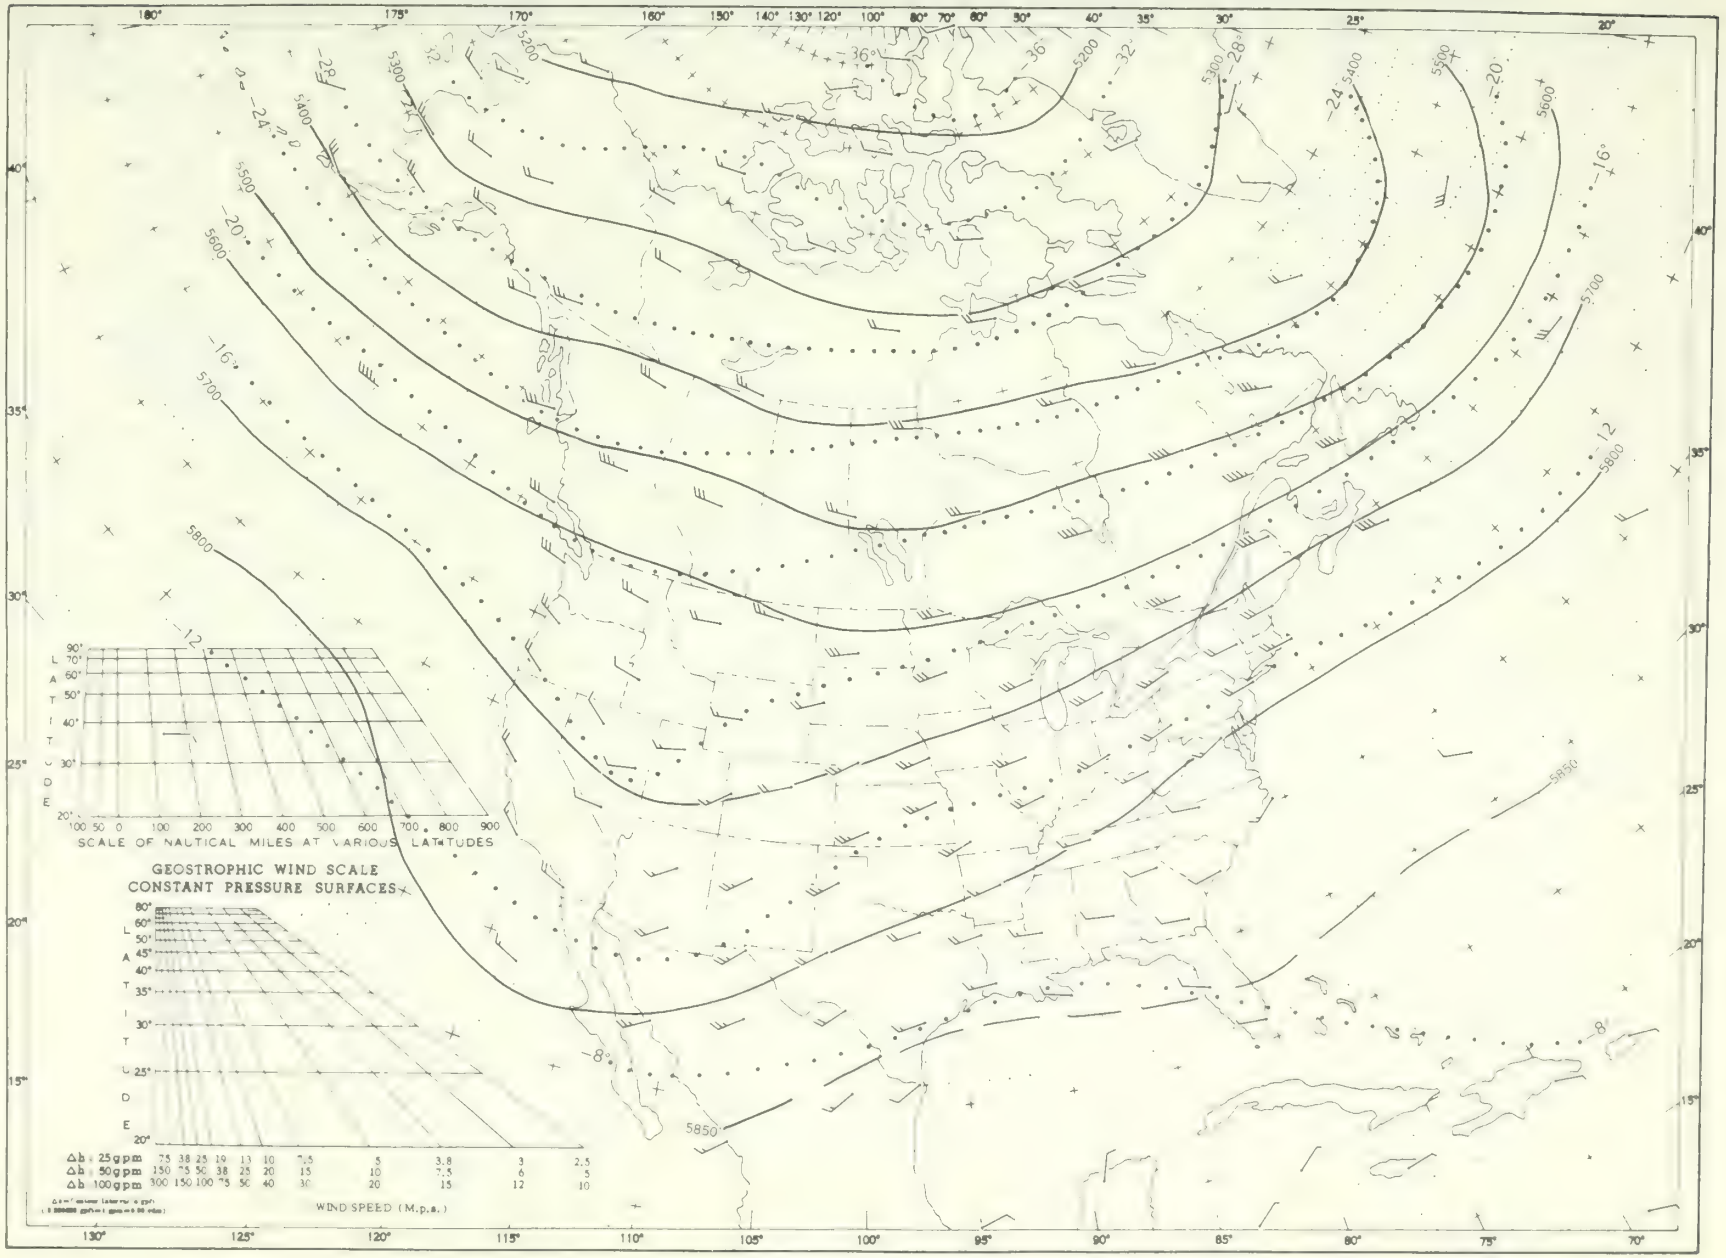
Circle indicates position of center at 7:00 a.m. e.s.t. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, October 1971. Inset Departure of Average Pressure (mb) from Normal, October 1971.



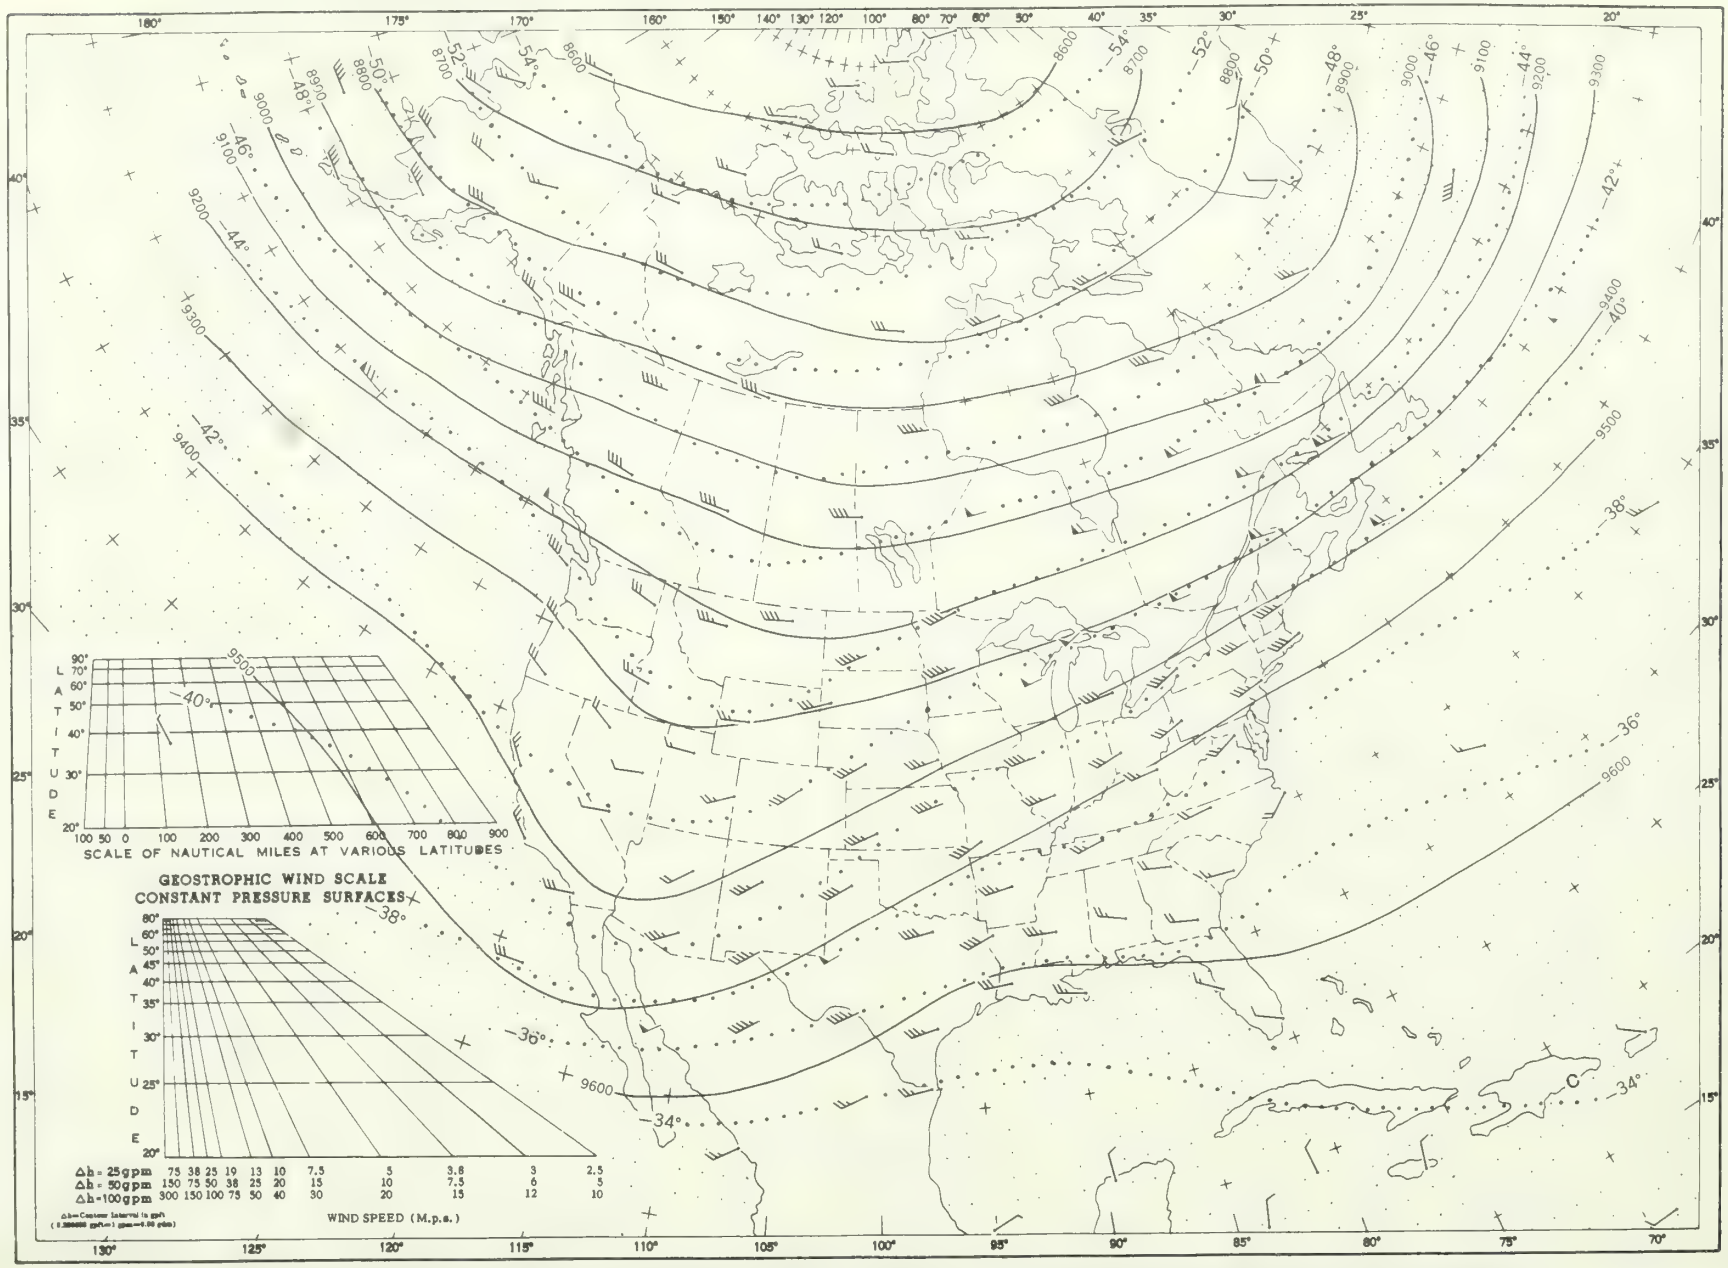
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10 intersections in a diamond grid over the oceans.

Chart XI 350-mb Surface, 1200 G.m.t., October 1971. Average Height and Temperature, and Resultant Winds



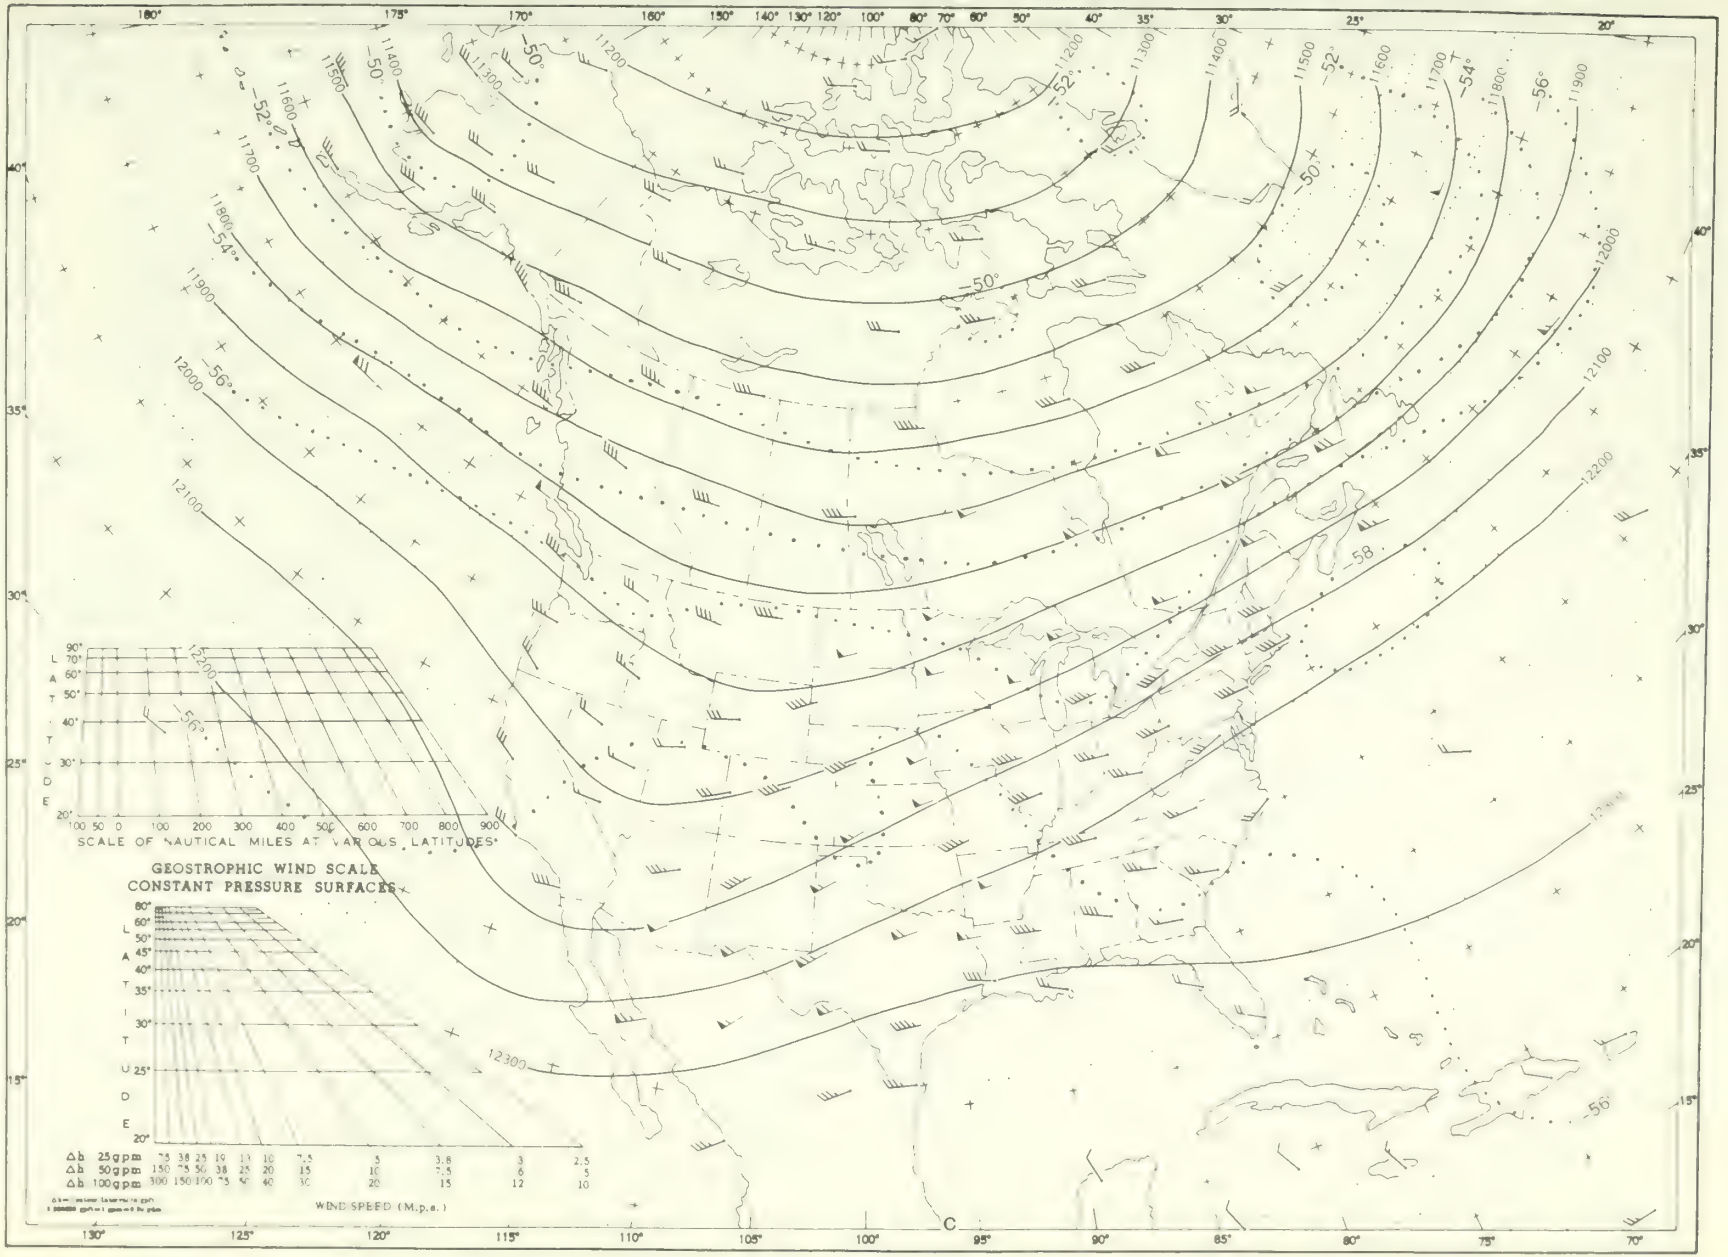
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 G.m.t., October 1971. Average Height and Temperature, and Resultant Winds



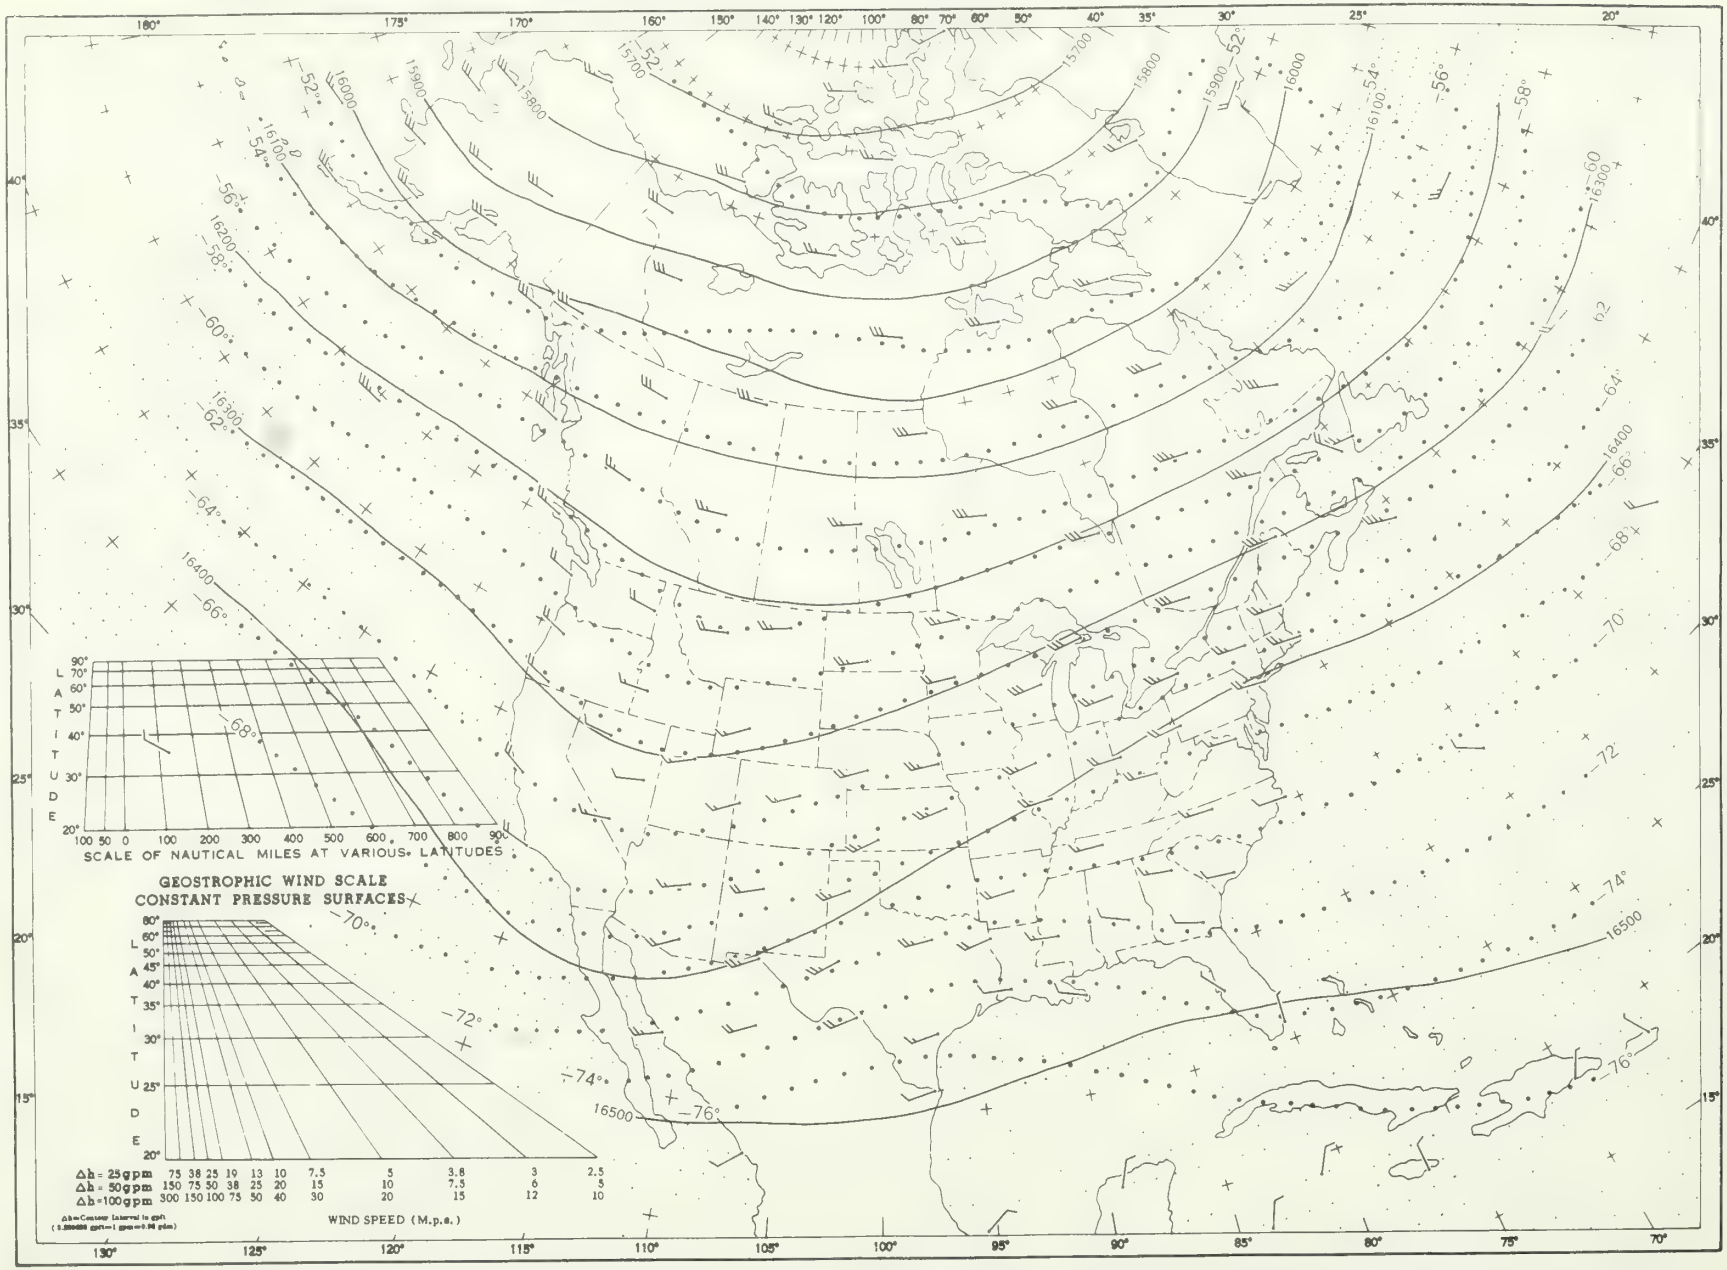
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII 500-mb Surface, 1200 G.m.t., October 1971. Average Height and Temperature, and Resultant Winds



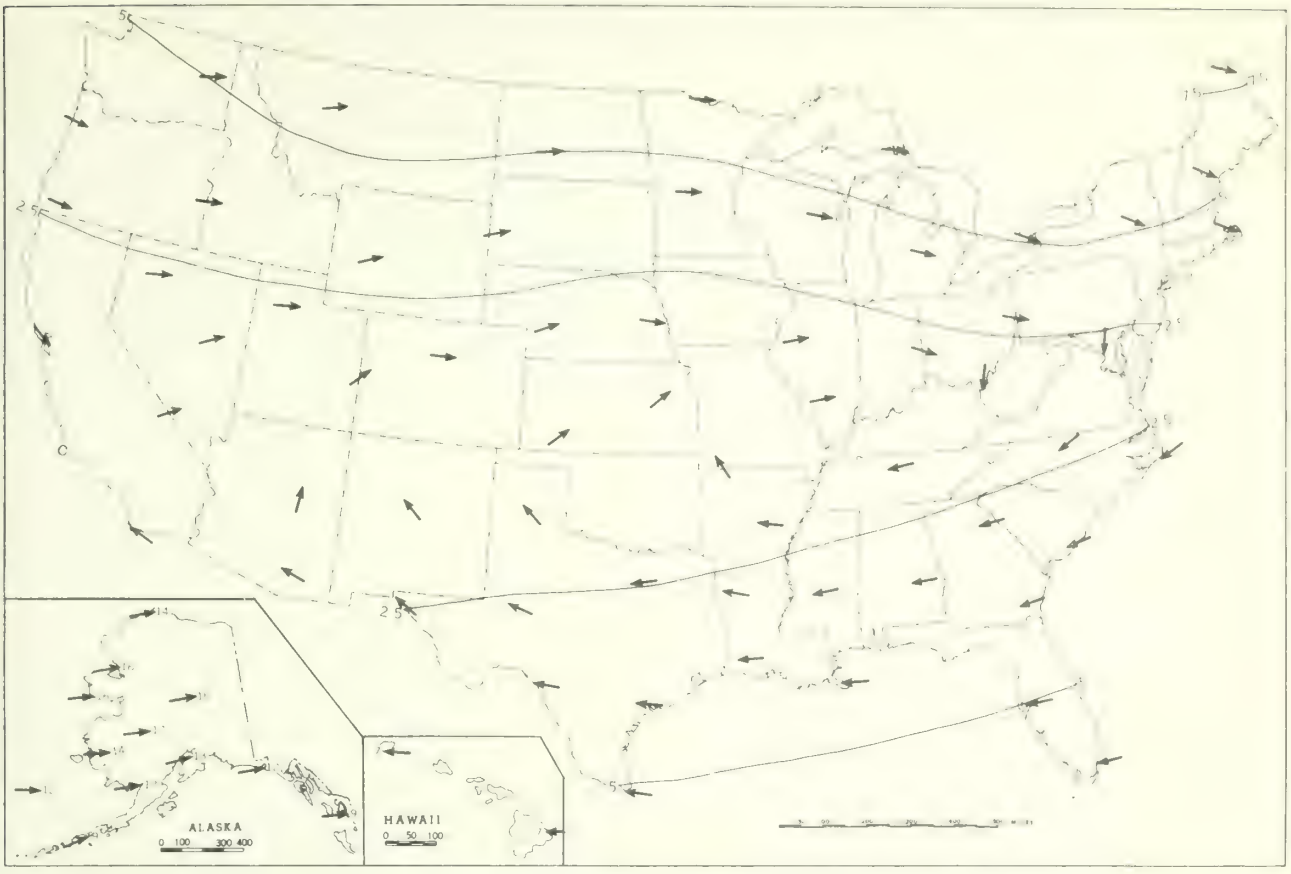
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV. 300-mb. Surface, 1200 G.m.t., October 1971. Average Height and Temperature, and Resultant Winds



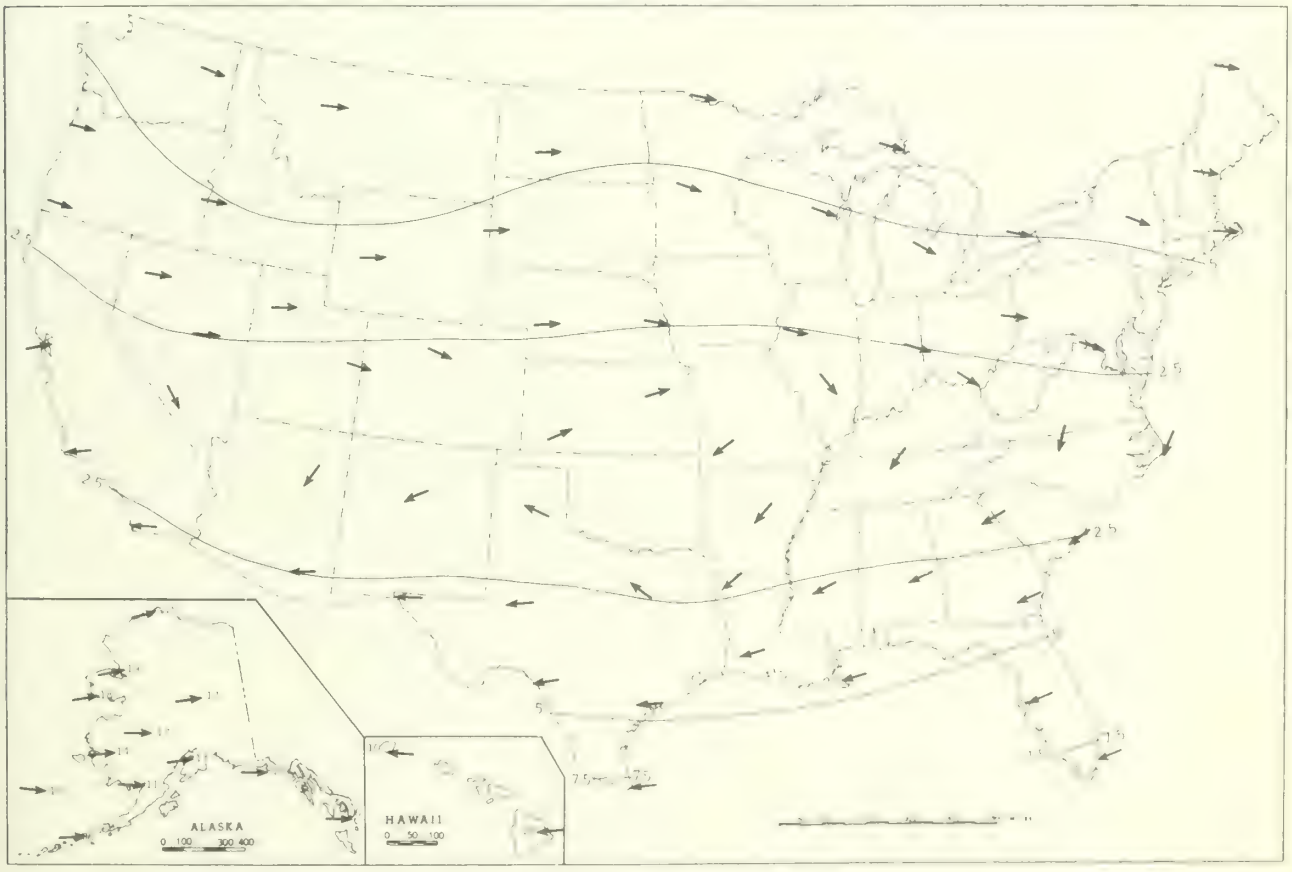
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb Surface, 1200 G.m.t., October 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI 100-mb. Surface, 1200 G.m.t., October 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 G.m.t., October 1971. Resultant Winds.

B. 30-mb. Surface, 1200 G.m.t., October 1971. Resultant Winds.

Wind speed (isotachs) in meters per second. Arrows show resultant wind direction. All wind data are based on rawin observations.

NOVEMBER 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. November was unusually dry in the Southwest and extreme Southeast but heavy rains fell over the northern and central Great Plains.
2. Heavy snow fell from the Great Lakes Region to the Northeast.
3. Temperatures averaged within a few degrees of normal in spite of the record high and record low temperatures that occurred and the frequent temperature changes.

TEMPERATURE -- November began with cold air covering the western and central States and unusually balmy summer weather from eastern Texas to the Atlantic and northeastward to New England. Jackson, Miss., registered 88° on November 2 and Washington, D. C., 85° on November 2. Never before have such warm temperatures occurred at Jackson and Washington so late in the season. The cold air from the west and north spread across the east and south in the first week of November bringing an end to the abnormally warm weather. Freezing temperatures plunged southward reaching northern Mississippi and Alabama by November 6. Meanwhile, the Far West warmed, becoming quite pleasant.

On November 9, a high pressure area centered over the central Appalachians brought record-low temperatures to the East. The temperature at Albany, N. Y., plunged to 11°, the coldest it had ever been so early in the autumn at Albany. Record low temperatures set in 1887 were broken at Rochester, N. Y., (20°), Boston, Mass., (24°), and Erie, Pa., (24°). The same High that brought record cold to the East warmed mid-America which enjoyed a period of Indian summer temperatures. Temperatures over the Great Plains warmed to the seventies. Pueblo, Colo., registered 83° on November 11 and Chicago, Ill., registered 78° on the 14th and St. Louis, Mo., recorded 81° on the 15th.

A cold front stretched from Wisconsin to western Texas at midmonth. It moved steadily eastward, tumbling temperatures as it advanced. Chicagoans enjoyed a number of days with temperatures 22° to 30° above normal but their highest temperature on the 19th was a chilly 42°. Freezing temperatures occurred as far south as Port Gibson, about 30 miles south of Vicksburg, Miss.

The last week of the month was cold over the East. Subfreezing temperatures occurred as far south as Montgomery, Ala., which registered 27° on the 23d when Elkins, W. Va., recorded only 4°. A number of stations in Minnesota recorded subzero weather; Hibbing, -6°. The central Appalachians and nearby portions of the Piedmont averaged 9° to 12° below normal in the last week of November. A moderating trend warmed mid-America. Pueblo, Colo., warmed to 69° on Thanksgiving Day, November 25. Moderate temperatures prevailed in southern California and Florida on most days in November.

PRECIPITATION -- Generous rains fell along the eastern seaboard on the first two days of November. Then followed three days of fair skies over most of the Nation. An exception was Palm Beach, Fla., where 5.05 inches of rain fell in 6 hours on November 4. This brought the November total to 9.11 inches, an all-time record for November, and the rains kept falling. About the beginning of the second week of November, a cold front brought rain, a few showers to the Pacific Northwest. Strong winds lashed the coastlines, gusting to 80 m.p.h. at Cape Blanco, Oreg. Another cold front set off rain and showers from the mid-Mississippi River Valley to the southern Great Plains. A touch of winter hit New England. An inch of snow covered Logan International Airport at Boston, Mass., on the morning of November 11. This was the earliest date that an inch or more of snow fell at Boston since November 6, 1894. Light rain fell in the Pacific Northwest at midmonth when snow flurries occurred over the Rocky Mountains. The snow increased, spread to the nearby Great Plains, and blanketed several states from Montana to Minnesota and southward to the northern portions of Arizona and New Mexico. Thunderstorms occurred along a cold front that stretched from Wisconsin to Texas. At the end of the third week, several inches of snow fell to the lee of the Great Lakes and flurries were seen at some distance from the Lakes. At some places, gusty winds accompanied the snow, the visibility was reduced, and automobile travel became hazardous.

A storm centered off the Washington coast brought more rainy weather to the coast and light snow to the Cascades and the Rocky Mountains. More miserable weather plagued the eastern half of the Nation. The weather was especially severe in the Northeast where heavy snow, freezing rain, gusty winds, and cold temperatures combined to make a storm comparable to that of the last week of November in 1950.

Monthly rainfall totals ranged widely from no rain at a few spots in the southwestern deserts to more than 14.0 inches near Puget Sound. Totals exceeded the normals in Oregon, nearby parts of neighboring states, and in the northern and central Great Plains. In Kansas, totals ranged from about 200 percent to more than 600 percent of normal.

Some record and near record daily and monthly precipitation and snowfall totals occurred in November. Pendleton, Oreg., received 1.35 inches of rain on the 26th. This is the largest 24-hour amount to have fallen at Pendleton in any November in the past 36 years. The November total for Pendleton, 2.73 inches, is the largest November total in the past quarter century. The October-November total precipitation at St. Cloud, Minn., 8.72 inches, was the largest October-November total in 72 years. Numerous locations in the Northeast received more snow than in any November in the 20th century. Most of the snow fell on Thanksgiving Day, November 25. This was one of the worst November snowstorms of record.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication
V Sun below horizon November 19 - 30, inclusive.
X Sun below horizon November 24 - 30, incli

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1 C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

V Sun below horizon November 19 - 30, inclusive.
X Sun below horizon November 24 - 30, inclusive.

Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:
1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
NOVEMBER 1971

Elmer R. Nelson, Office of Hydrology

Major flooding occurred along the lower reaches of the Pee Dee River in South Carolina during the first part of November. However, flooding in South Carolina was much less severe than during the previous 3 months.

Major flooding occurred on the extreme lower Nueces River in Texas during early November due to excessive rains during mid-October.

Significant flooding occurred on tributaries of the Arkansas River in the southwest quadrant of Kansas during mid-November. The Coon Creek tributaries flooded as much as one-half of Kinsley, Kans., with water up to 1 foot or more deep.

ATLANTIC SLOPE DRAINAGE

Minor flooding occurred in central New Jersey on Nov. 29-30 due to 1 to 1.5 inches of rain. The Assunpink Creek at Trenton, N. J., crested 2.4 feet above flood stage on the 30th. The Millstone River crested less than 2 feet above flood stage and the Raritan, 0.5 foot and less above flood stage on the 30th.

Reservoirs in New Jersey were near or at full capacity by the end of November due to above normal precipitation for the past 4 months. New York City's three reservoirs on the upper Delaware decreased storage during November by 5.5 billion gallons to an average of 43 percent of useable capacity at the end of the month.

The flooding on streams in eastern North Carolina in the beginning of November was due to heavy rains on Oct. 16-25. Heavy rain (around 1 inch) in south-central Virginia on the 3d-4th did not produce any additional overflow.

Flooding in South Carolina was much less severe during November than during the previous 3 months. Rainfall totalled 3 to 5 inches during the first 3 days of the month. Major flooding occurred along the lower reaches of the Pee Dee River from Peedee, S. C., to the coast. Minor flooding occurred along the upper Saluda River and the lower reaches of the Broad River. The Lumber River at Lumberton, N. C., continued above flood stage from Oct. 3 to Nov. 10, with the highest crest of 10.3 feet (flood stage 9 feet) occurring on Nov. 3. Minor flash flooding occurred on small streams in Greenville, S. C., but damage was minor. The elevation of Lake Marion rose about 1-1/2 feet during the month and had 1.8 feet of vertical storage left at the end of the month.

MISSISSIPPI SYSTEM

Upper Mississippi Basin - November precipitation was above normal in the Upper Mississippi Basin above Gutenberg, Iowa, except near normal over the northern sections. Precipitation fell in the form of snow during the last half of the month in northern sections and the last third of the month in southern sections. By the end of November, snow cover ranged from 2 to 10 inches with the heavier amounts in west-central Minnesota. There was little or no frost penetration prior to the snow.

Total precipitation for October and November reached 5 to 8 inches over the Minnesota, Upper Mississippi, Chippewa, and St. Croix Drainages. Some of the heavier amounts for the 2-month period were 8.35 inches at Minneapolis, 8.16 inches at Duluth, and 6.16 inches at St. Cloud, Minn.

Runoff from this precipitation resulted in rises on most streams of from 2 feet to 5 feet from the last week in October through the first 10 days in November. All were well below flood stage except that at Fort Ripley on the Upper Mississippi the peak was 9.7 feet, 0.3 foot below flood stage. Only minor rises occurred on the Wisconsin River. Flows on the Mississippi River above Minneapolis and the St. Croix River reached the highest flows on record for the month of November.

Arkansas Basin - Heavy rains over the Texas and Oklahoma panhandles on the 16th-17th caused minor flooding on the North Canadian River at Woodward and Seiling, Okla. No damage was reported.

Minor flooding occurred on the Arkansas River from Kinsley, Kans., to Great Bend, Kans., between the 18th and 20th. Flooding occurred on tributaries of the Arkansas in southeastern Hodgeman, northwestern Edwards, and southwestern Pawnee Counties in Kansas due to locally heavy rains during the late evening of the 16th and early on the 17th. The flooding began early on the 17th and was confined to the immediate area of the small streams except for an area of a few miles above Kinsley, Kans., on the Coon Creek tributaries. The Kinsley flooding resulted in shallow surface water over as much as one-half of the city with depths ranging from a few inches to a foot or more. There was no monetary damage from the Arkansas overflow. Damage from the Coon Creek overflow was estimated at $112,500, most of which occurred within the city of Kinsley, Kans.

Red Basin - The flooding on the Sulphur River in northeastern Texas was due to heavy thunderstorms during the night of Oct. 19-20. Flooding continued at Naples, Tex., from Oct. 23 to Nov. 2. The crest on Oct. 26 was 7.7 feet above flood stage.

WEST GULF OF MEXICO DRAINAGE

Minor flooding occurred in northeastern Texas on the upper Sabine River at Mineola, Tex., on Oct. 22 to Nov. 4. The crest at Mineola, Tex., on Oct. 24 was 3.5 feet above flood stage. Cattle along the Sabine River were moved to higher ground. The heaviest rainfall during November occurred during the middle of the month in the Sabine Basin.

The Trinity River at Long Lake, Tex., continues in flood from Oct. 26 to Nov. 1. The crest on Oct. 30 was 5.1 feet above flood stage. The damages during October were estimated at $896,000 by the Corps of Engineers.

The flooding along the Nueces River near Tilden, Tex., and below the Wesley Seale Dam, Tex., during the first 7 days of November was due to heavy rains that began during the early part of October with excessive rains during mid-October. Lake Corpus Christi was full before the rains and water from upstream flowed through unretarded to crests near Mathis, Tex., on Oct. 13, Oct. 18, and Oct. 23. Major flooding resulted along the extreme lower Nueces.

PACIFIC SLOPE DRAINAGE

Coquille Basin - Heavy rain (4 to 7 inches) on the 24th-28th in southwestern Oregon caused two periods of overflow along the South Fork Coquille from the 27th to the 30th. Rainfall amounts of 3 inches were common on the 26th. The South Fork Coquille reached flood stage at Myrtle Point, Oreg., late on the 26th and remained near or over flood stage until the afternoon of the 30th. Flooding along the Coquille River is frequent during the winter months and generally follows any period of prolonged rain in the coastal mountains of southwestern Oregon. Damage from the flooding was

minimal and restricted to pastureland siltation, river bank erosion, and some very minor road damage.

Columbia Basin - Measurable precipitation was observed in the Columbia Basin west of the Cascades on about 22 days during the month of November.

The month began with 2-inch rains along the north Oregon and southwest Washington coasts and less than 1-inch amounts in the Willamette Valley and Cascade range.

The second storm series, on Nov. 10-14, deposited 5 inches along the Oregon coast, 2-inch amounts in the Willamette Valley, and near 3.5 inches at Cascade range stations. This moisture wetted the Willamette and coastal basins but produced only minor streamflow rises.

The third monthly storm series, which began on Nov. 23 and lasted until the 29th, deposited 8 to 9-inch amounts along the Oregon coast, 4-5 inches in Willamette Valley, and 7-10 inches along the Cascade range.

By early on the 26th, all streams, coastal and Willamette Basin tributaries, were rising rapidly with the coastal Siletz, the Mary's, Santiam, and upper Tualatin Rivers cresting above bankfull by late evening on the 26th. In the local Portland area Johnson Creek at Sycamore exceeded flood stage (8 feet) with a crest of 9.5 feet at noon on the 26th. Other tributaries experienced sharp rises but crests were below bankfull.

Flows on coastal and Willamette tributaries did not recede very much from the crests of the 26th and, with continued rainfall occurring, secondary crests were noted by the 29th. These second crests were generally below bankfull, except for the Santiam River at Jefferson and the more sluggish Luckiamute, South Yamhill, and upper Tualatin Rivers.

The main stem Willamette River at Salem, Oregon, reached a high point of 20.4 feet early on the 29th but with continued runoff from tributaries was rising again by the morning of the 30th and attained a crest of 21.6 feet on Dec. 1 which slightly exceeded bankfull levels.

Damages from the flooding were estimated by the Corps of Engineers at $276,000.

Northern Coastal Basins - Minor flooding occurred in the Snohomish and Snoqualmie Rivers on Nov. 4-5 due to heavy rain (3-4 inches, locally 6 inches) and snowmelt. There was shallow overflow of farmlands and low-lying roads near both rivers. Damage was minor, estimated at $72,000 in the Snoqualmie Basin and $10,000 in the Snohomish.

Note: [illegible] the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at [illegible] to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

[illegible] in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate [illegible] ations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.c.t.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun.

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Note.--Langley is the unit used to denote one gram calorie per square centimeter.

Values with an asterisk are interpolated.
U Indicates Urban sites.

The solar radiation data in this table form the basis for the analyses in Charts VII. A. and B. of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska

NOVEMBER 1971

Date	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys	- 51	-134	- 84	- 72	- 47	- 58	- 70	- 64	- 61	- 26	- 39	- 70	- 62	- 62	- 78	- 46	- 27	- 68	- 68	- 82	- 38	- 64	- 68	-119	-199	-161	- 85	- 95	- 25	- 63		- 75

The measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (λ 3900 Å)

Date	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys													NO DATA - MACHINE MALFUNCTION																			

These data are from an U - V Epplev total ultra violet sensor and Speedomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Means O_3
	Data will be delayed																															

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e. the amount contained in a vertical column of unit cross-section extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone usually quoted [illegible] is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g. [illegible] milli atmo-cm ozone implies an ozone layer [illegible] thick. The code [illegible] designates the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), November

B. Temperature Departure from 30 - Year Mean (°F 1931-60), November 1971.

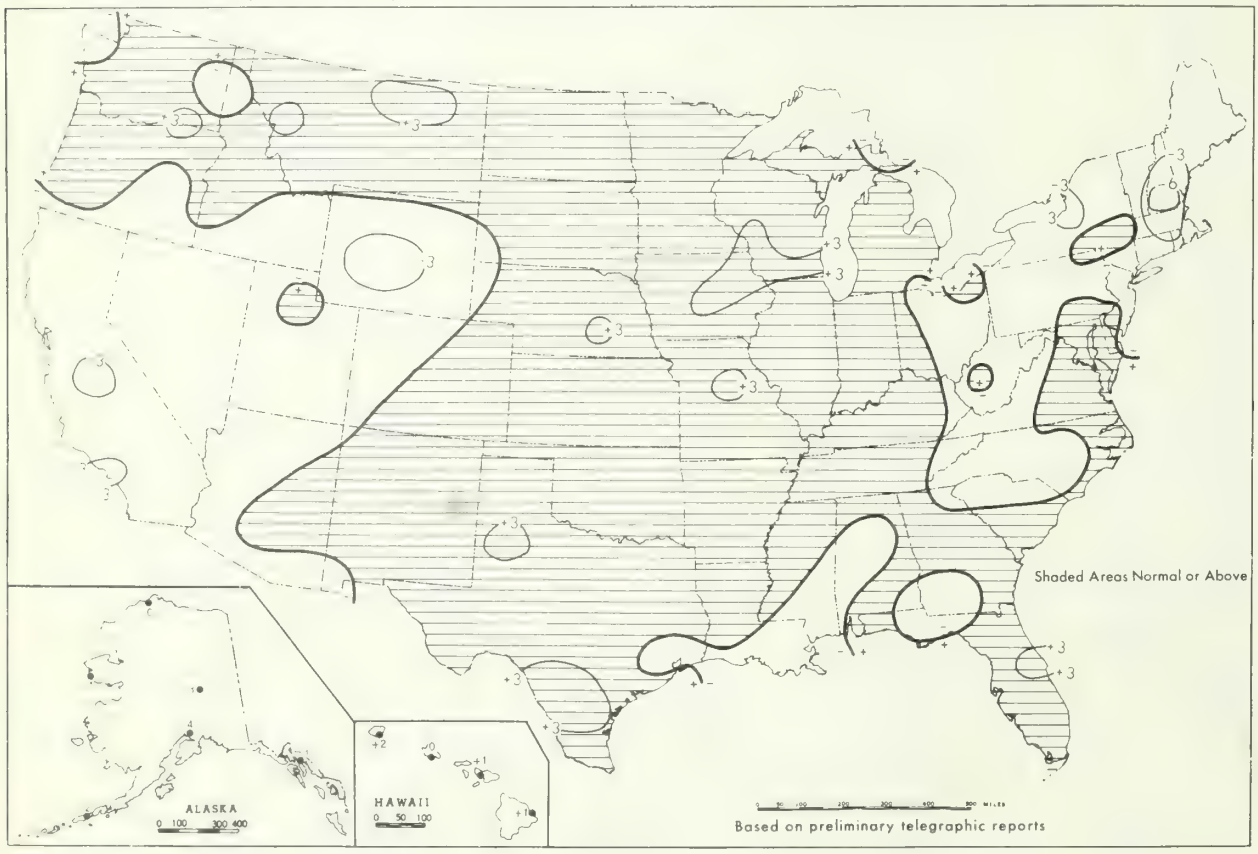

Chart II. Total Precipitation (Inches), November 1971.

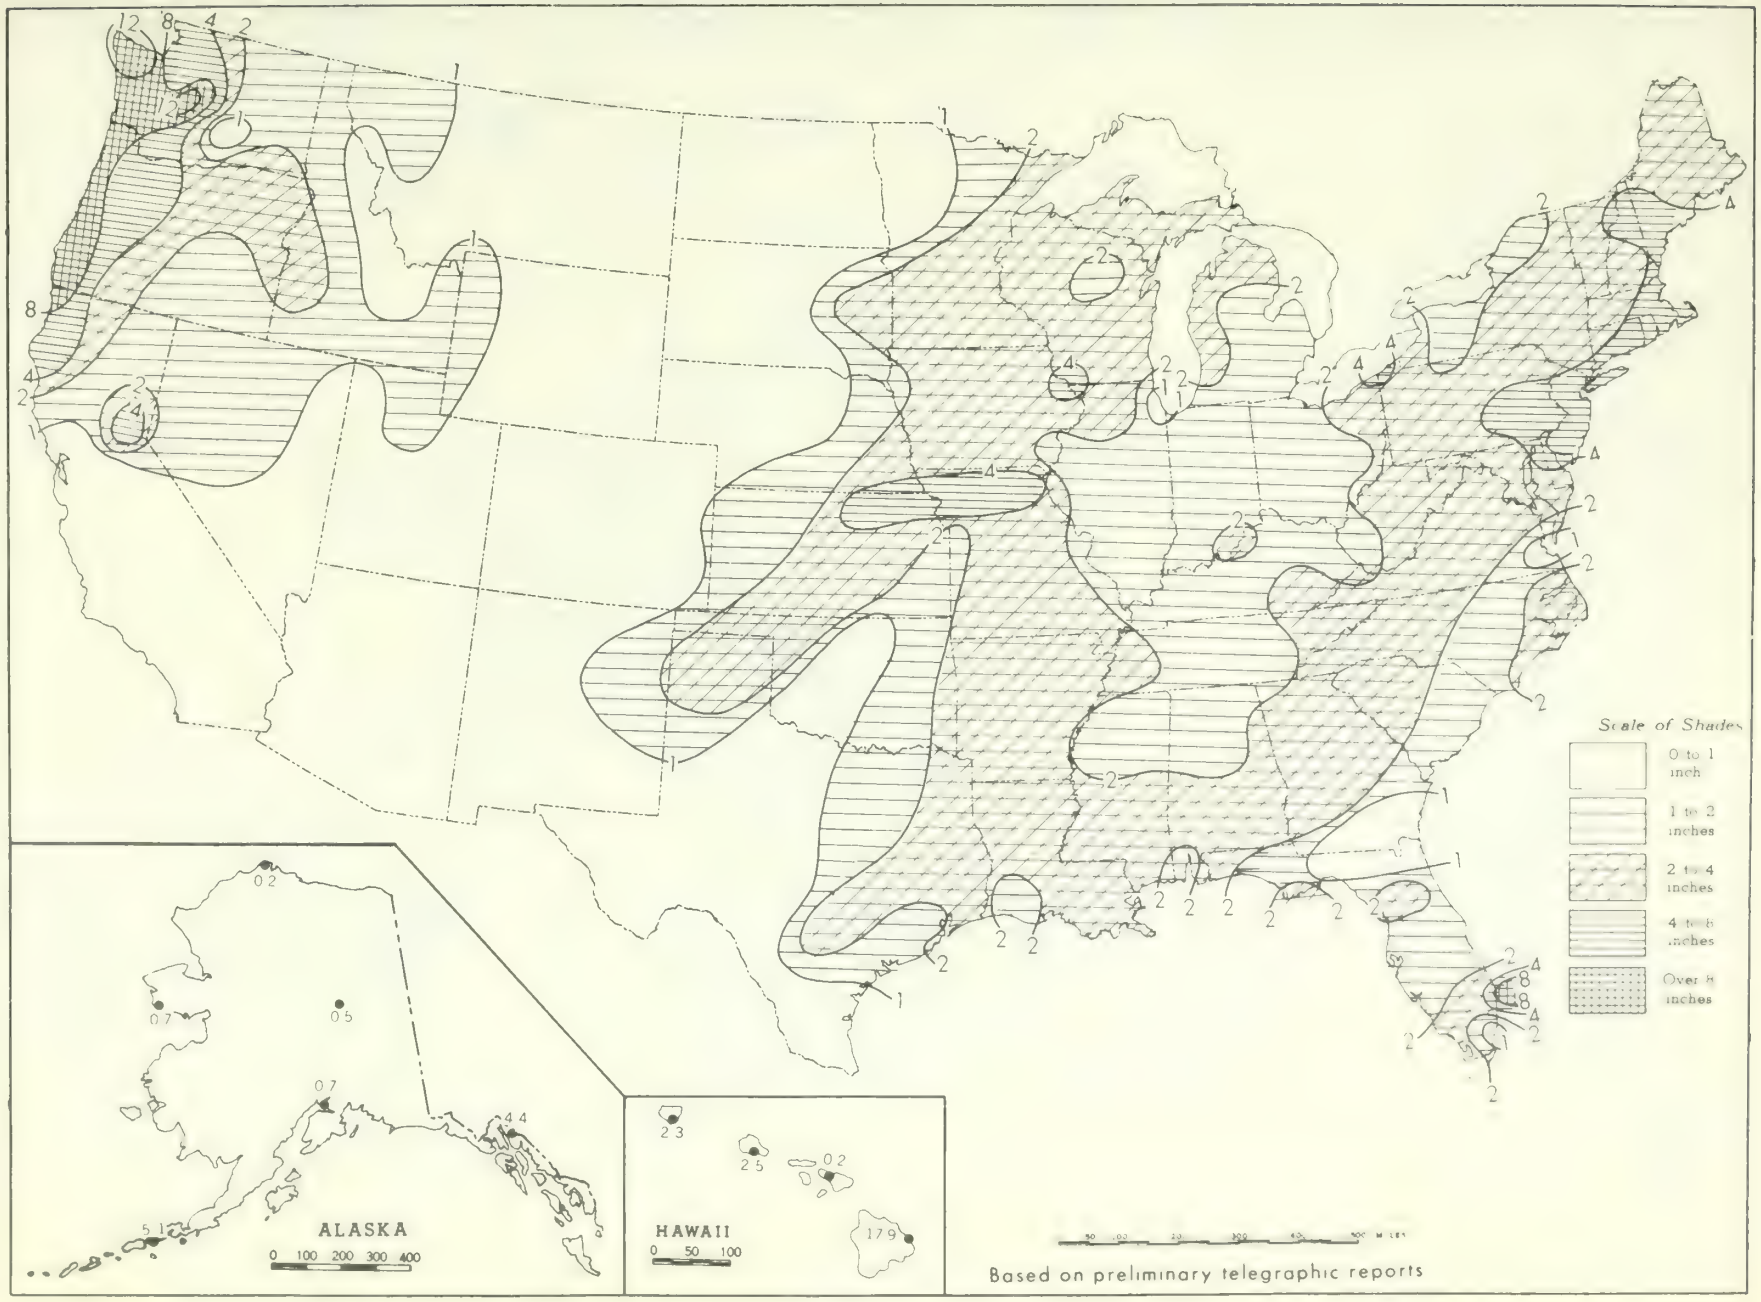

Chart III. Percentage of Normal Precipitation, November 1971.

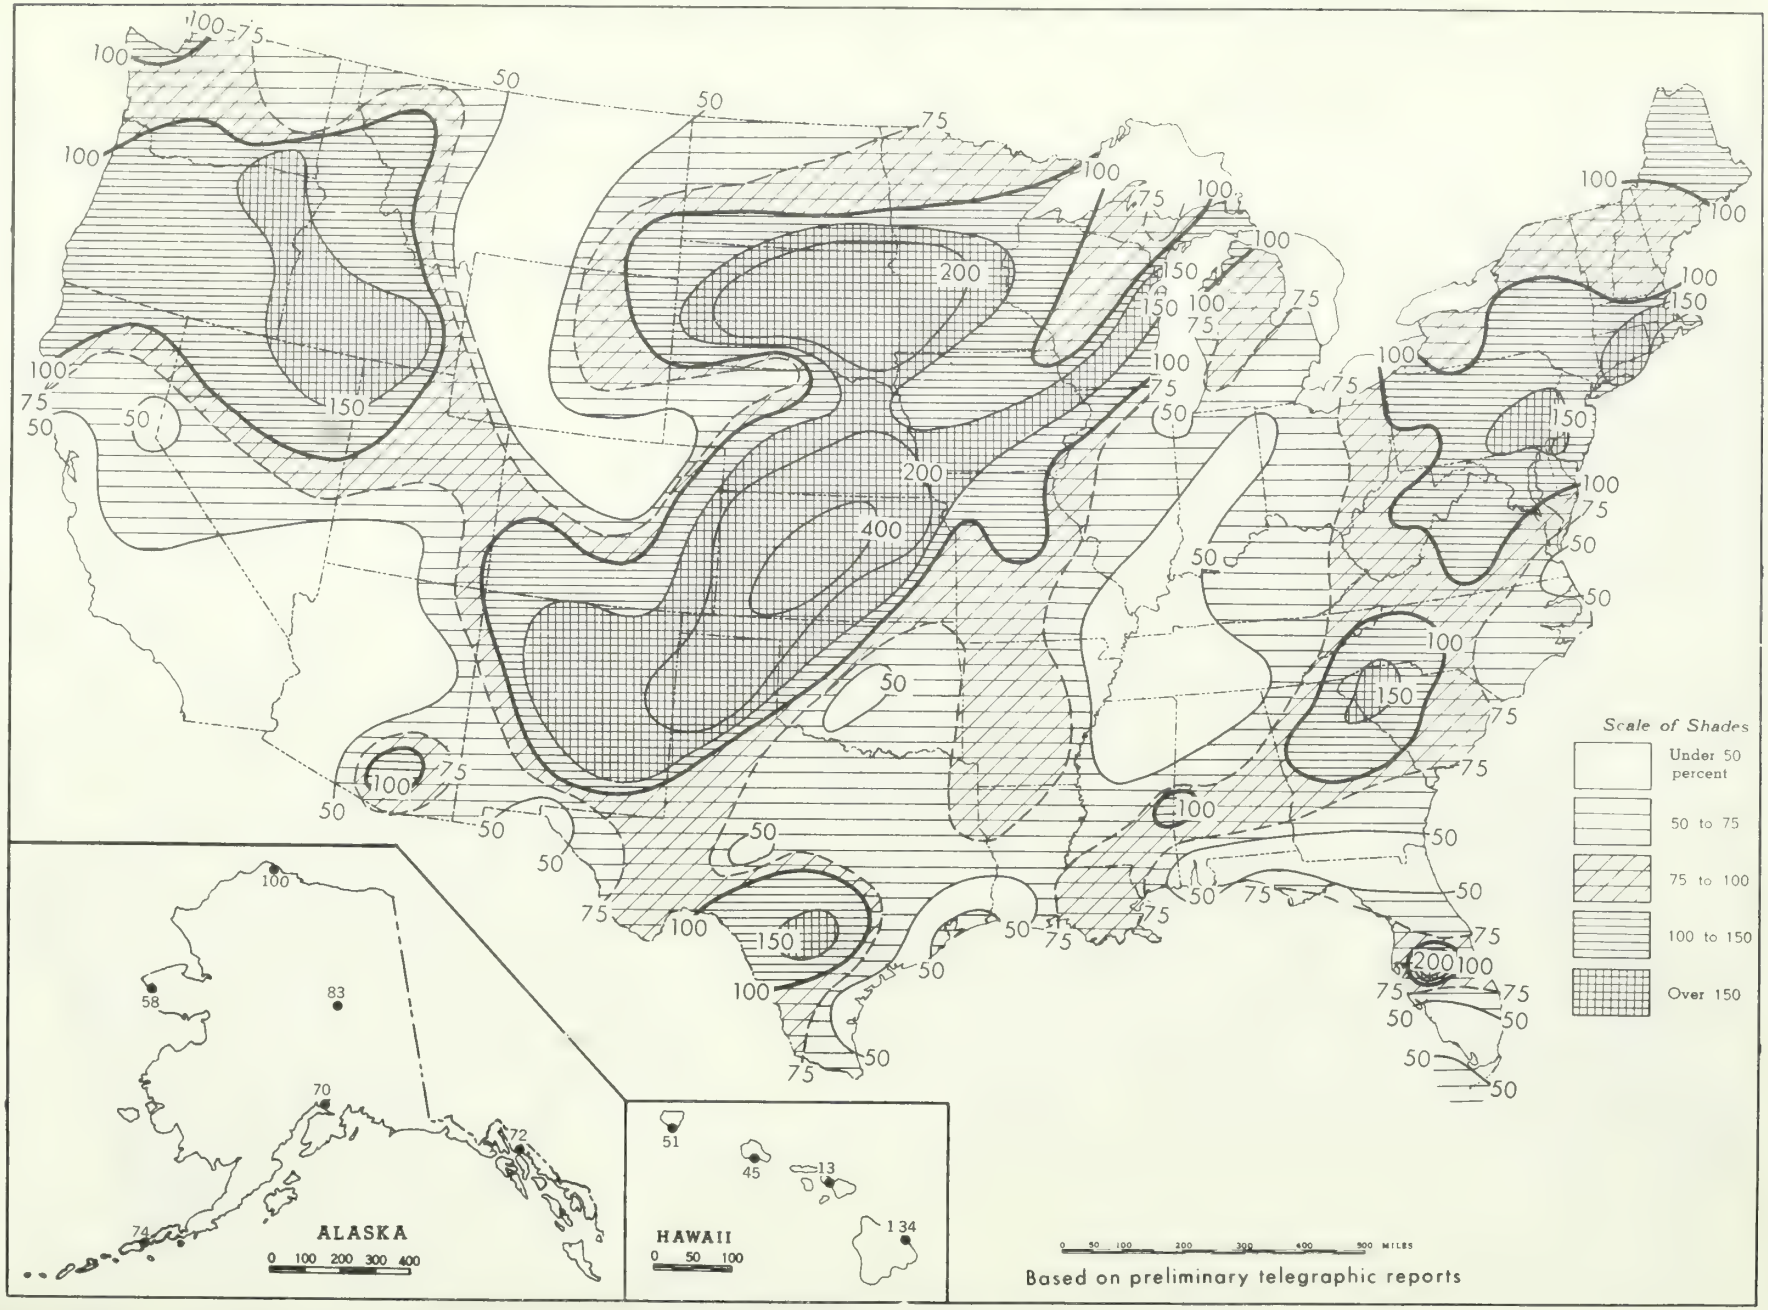

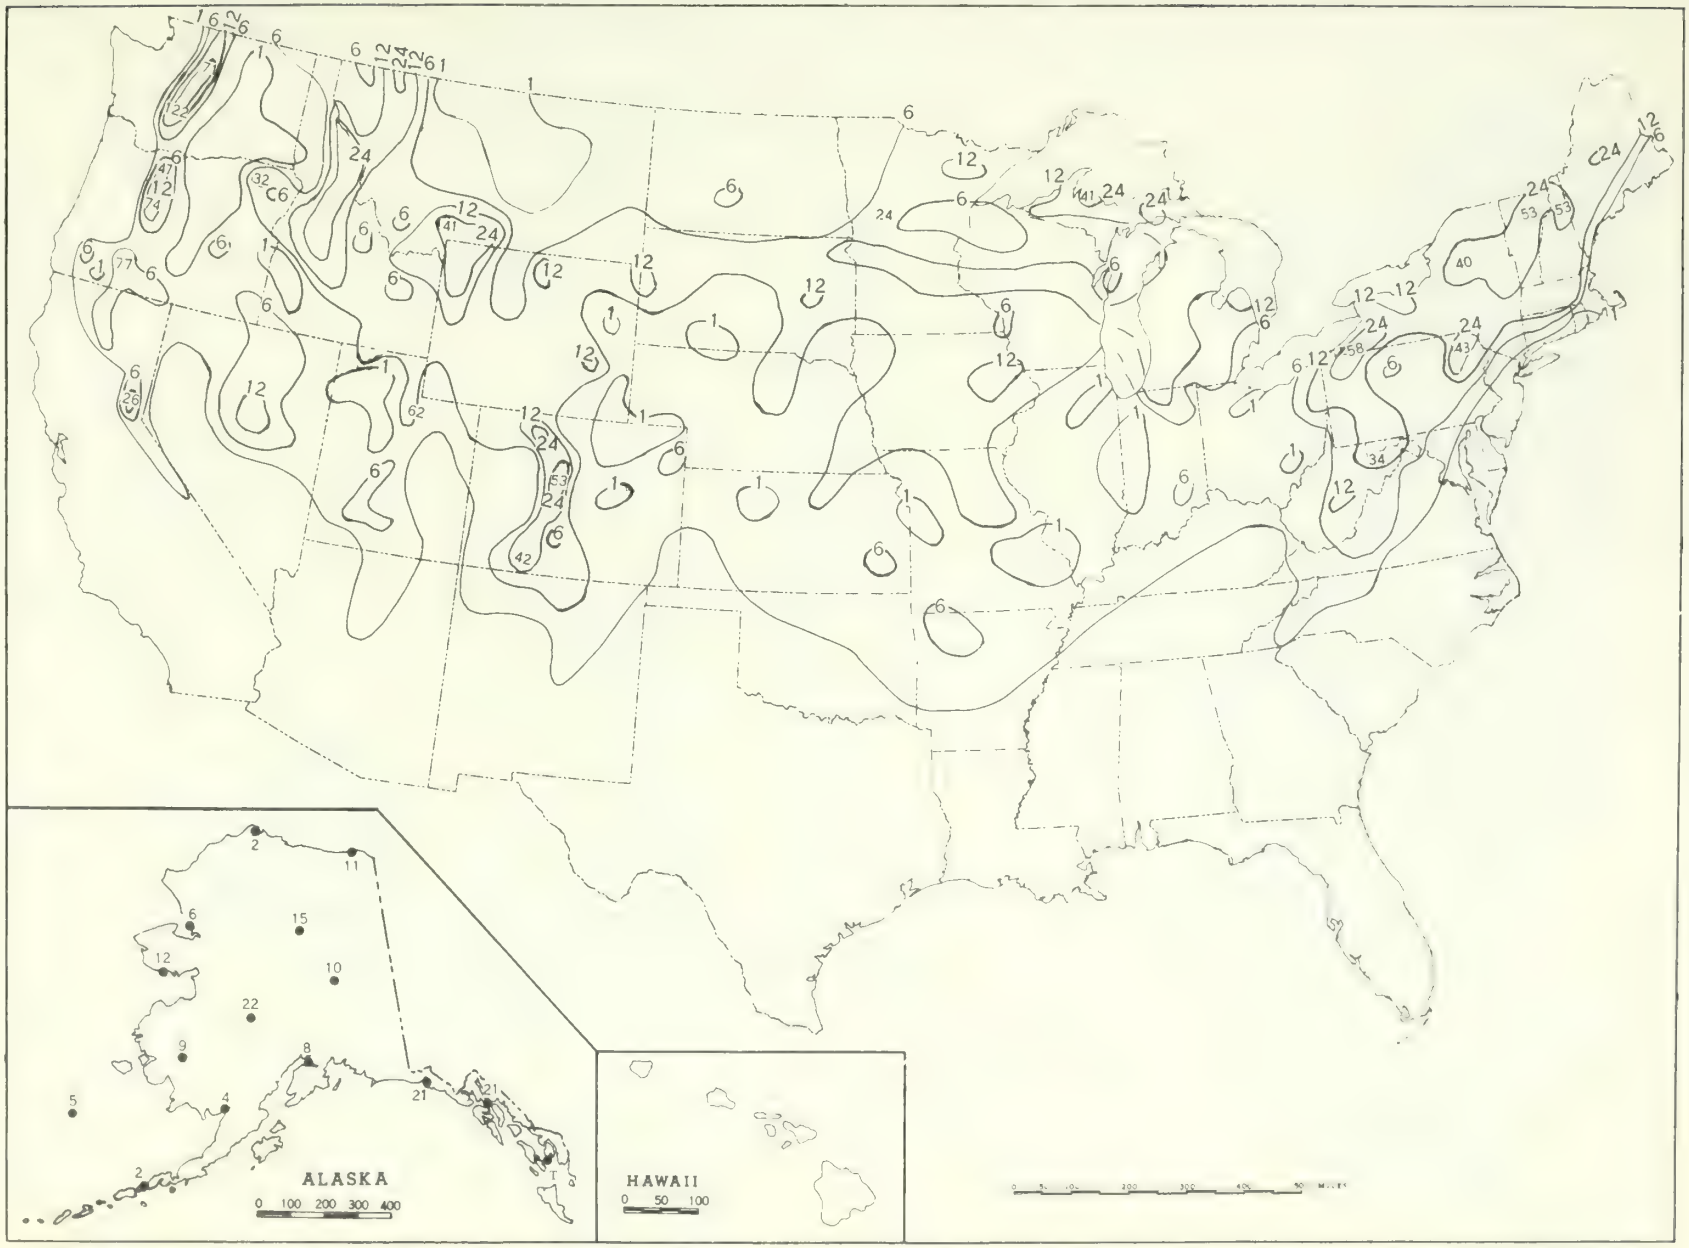

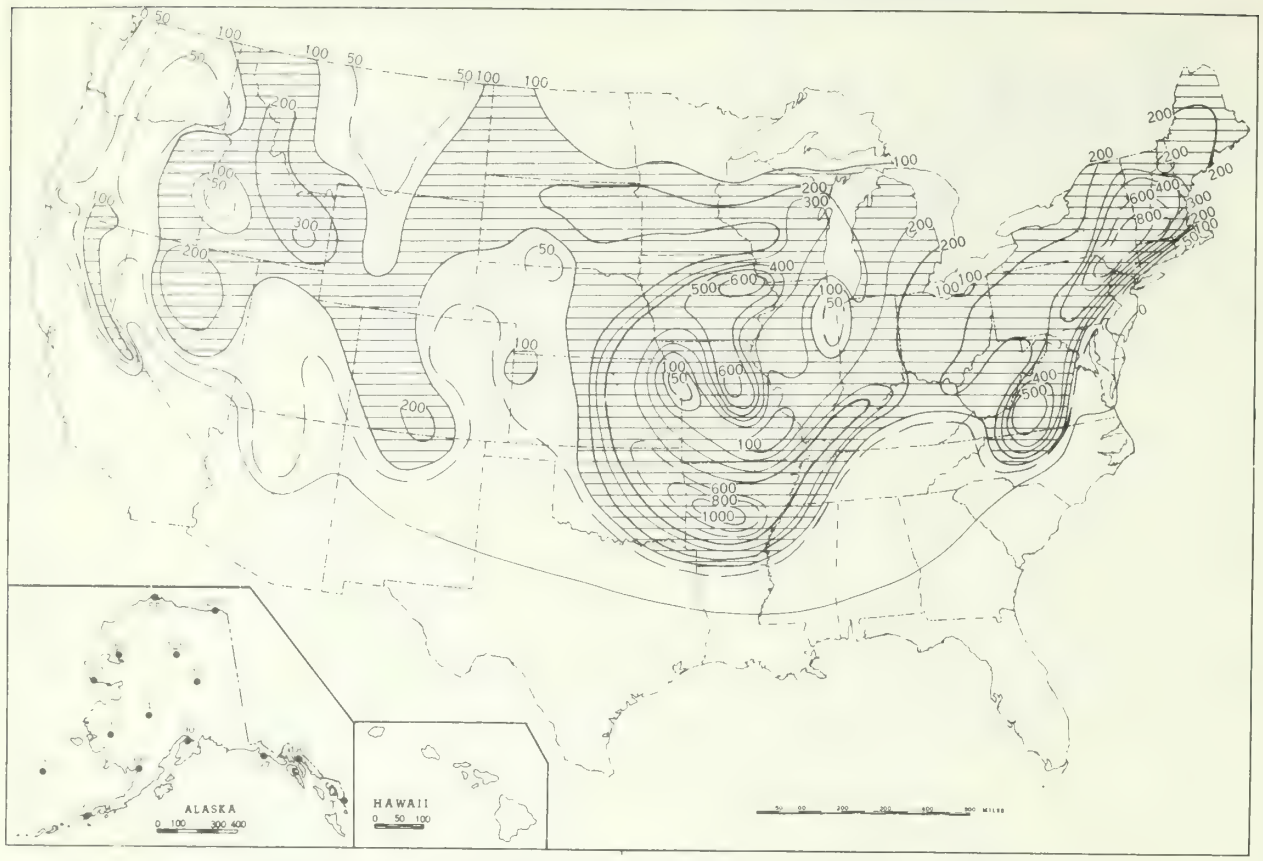

Chart IV. Total Snowfall (Inches), November 1971.

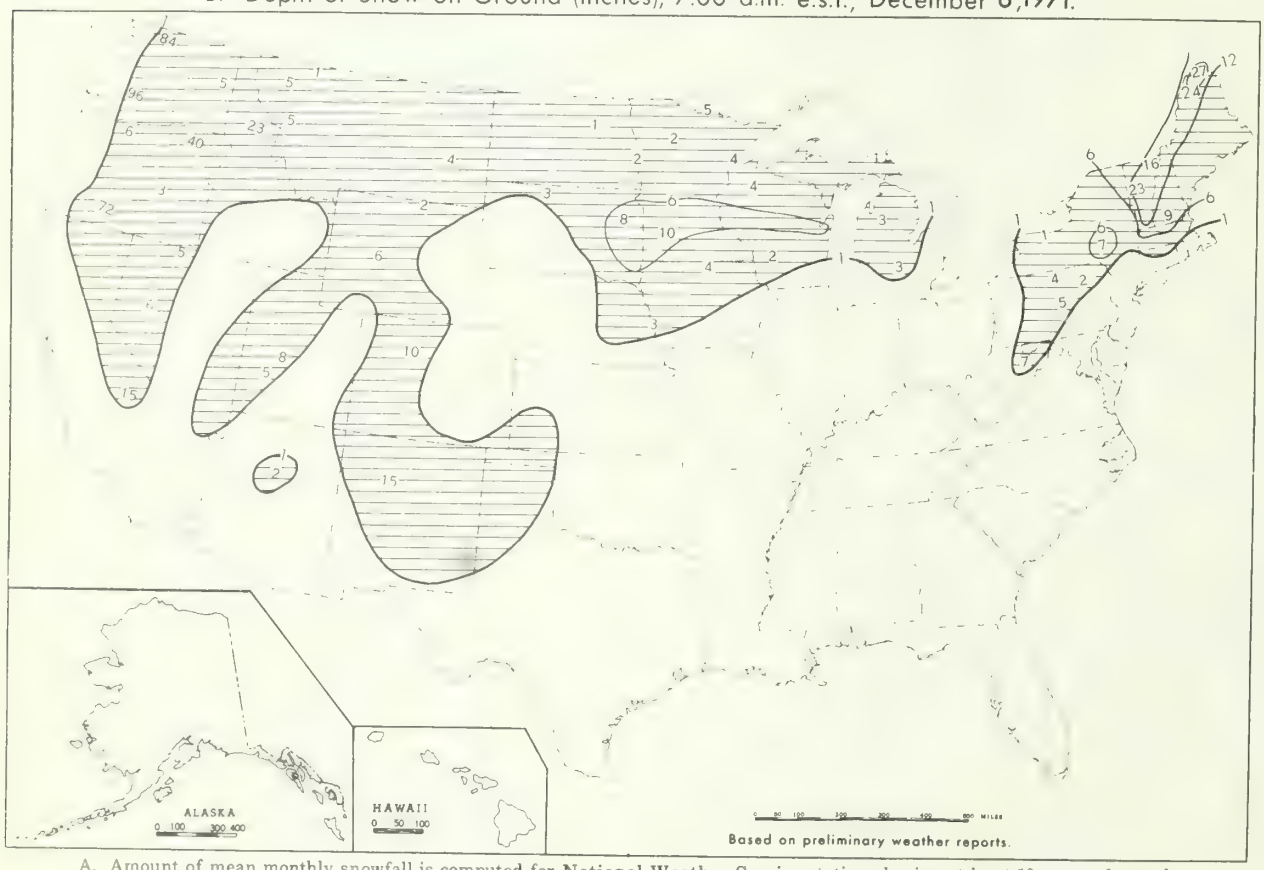
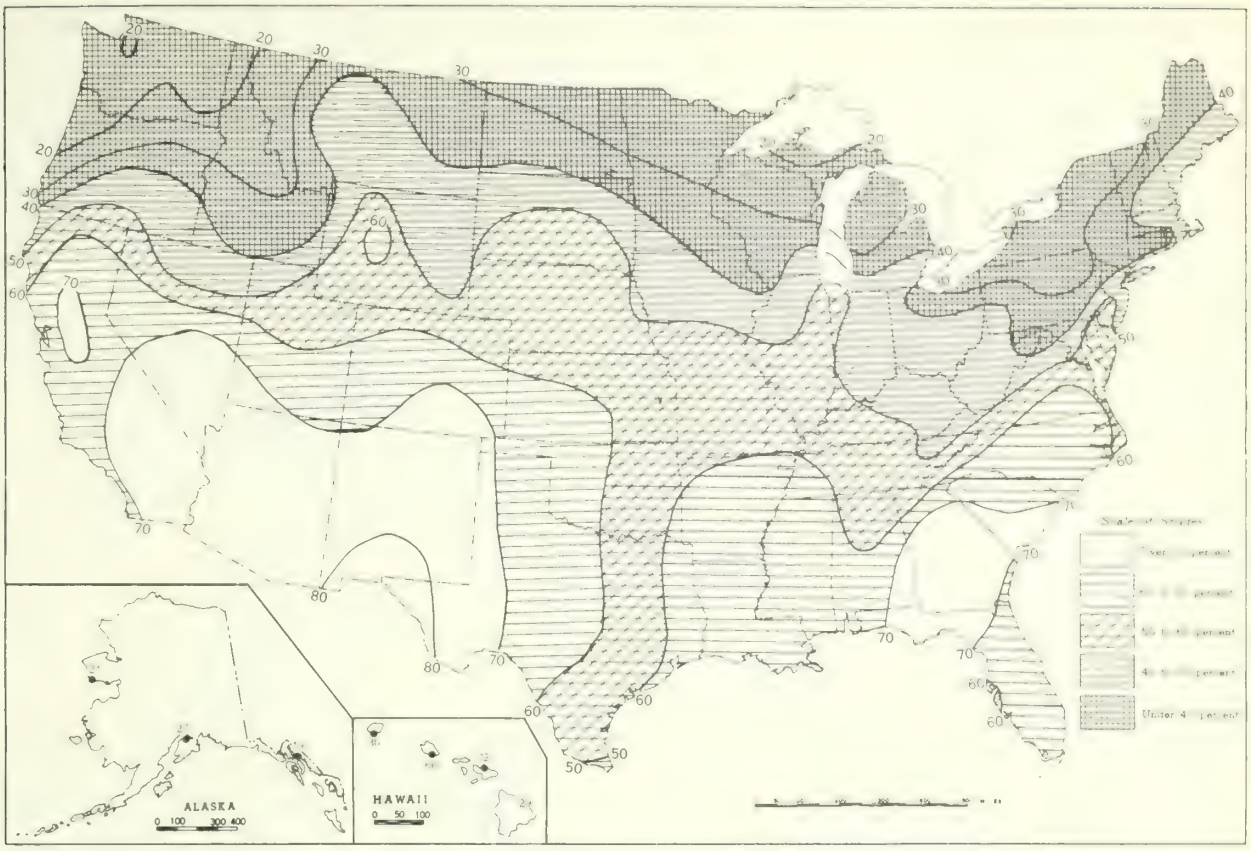
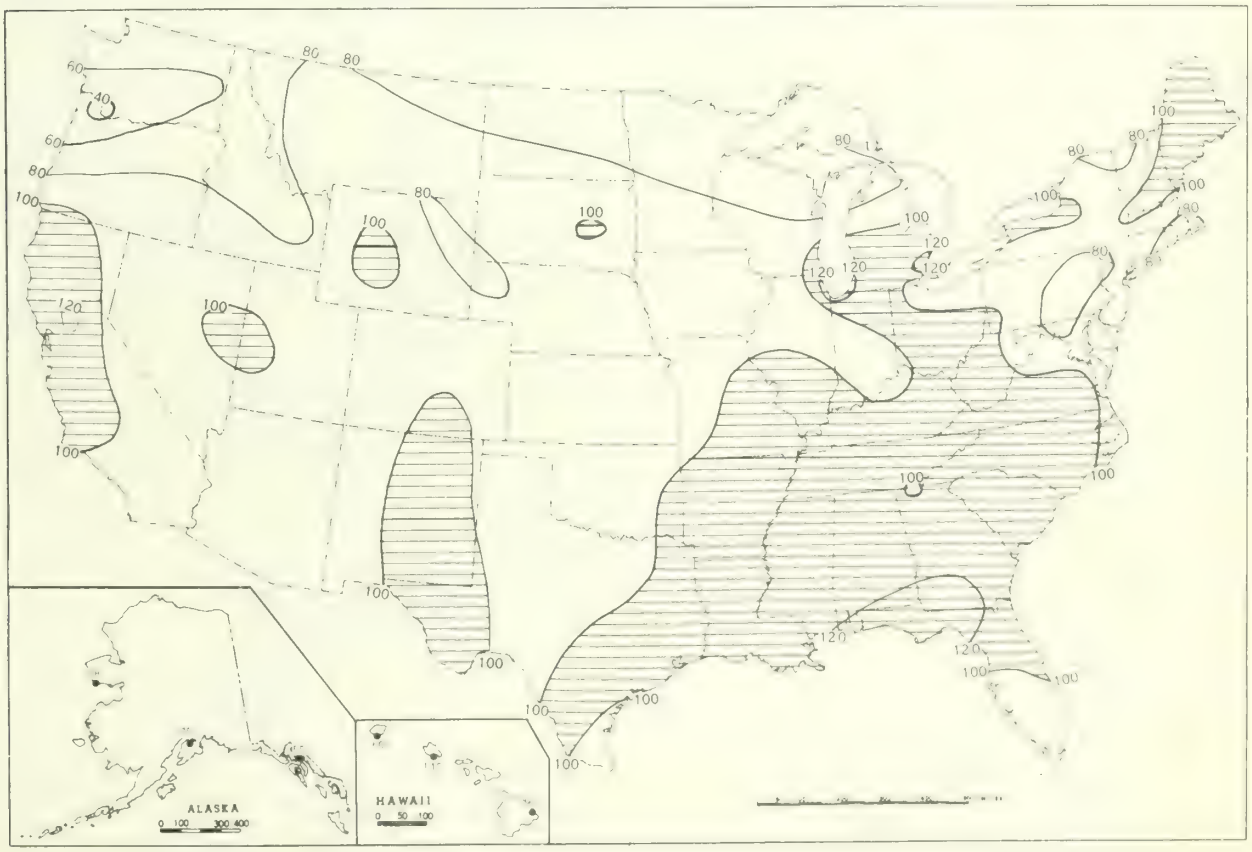


This is the total of unmelted snowfall recorded during the month at **National Weather Service** and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the Far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, November 1971.

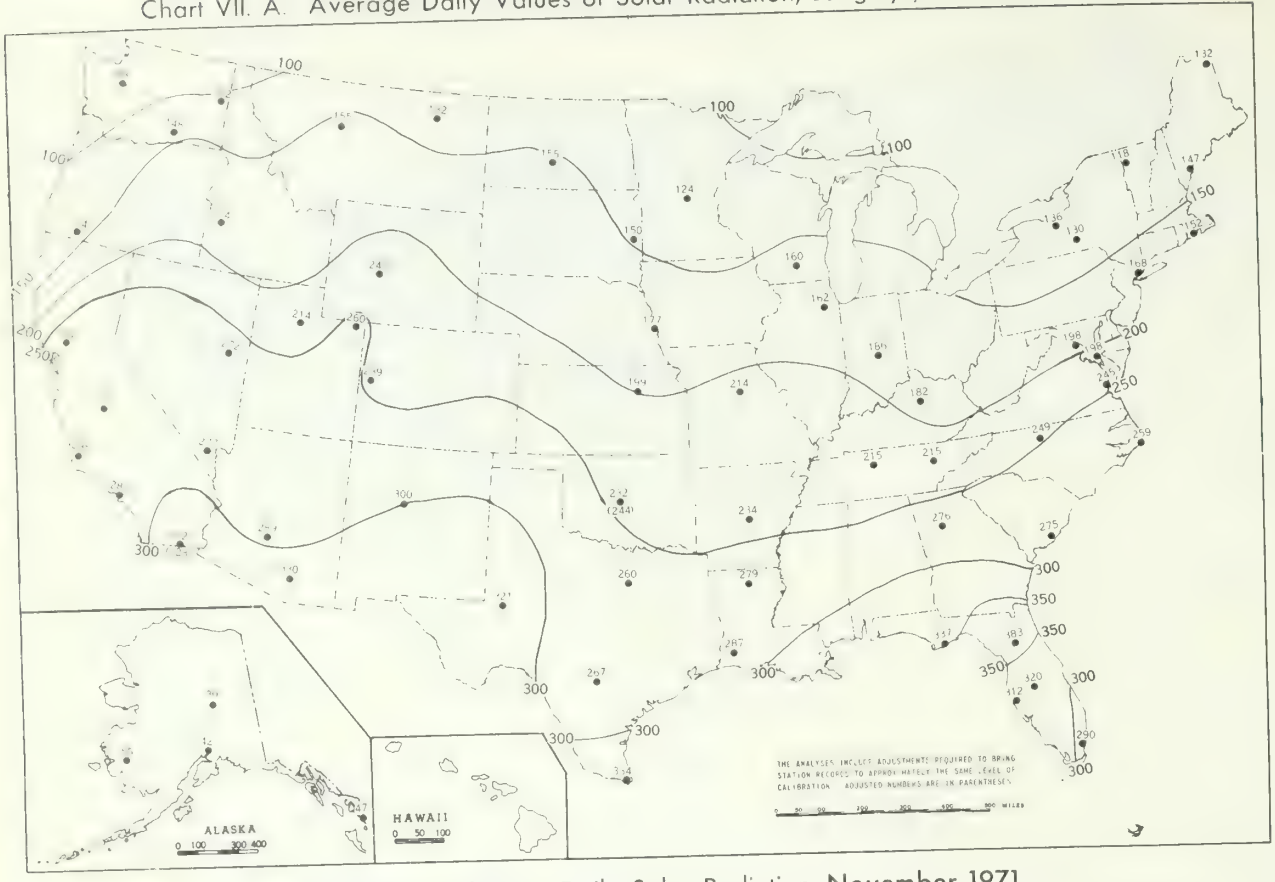


B. Depth of Snow on Ground (Inches), 7:00 a.m. e.s.t., December 6,1971.

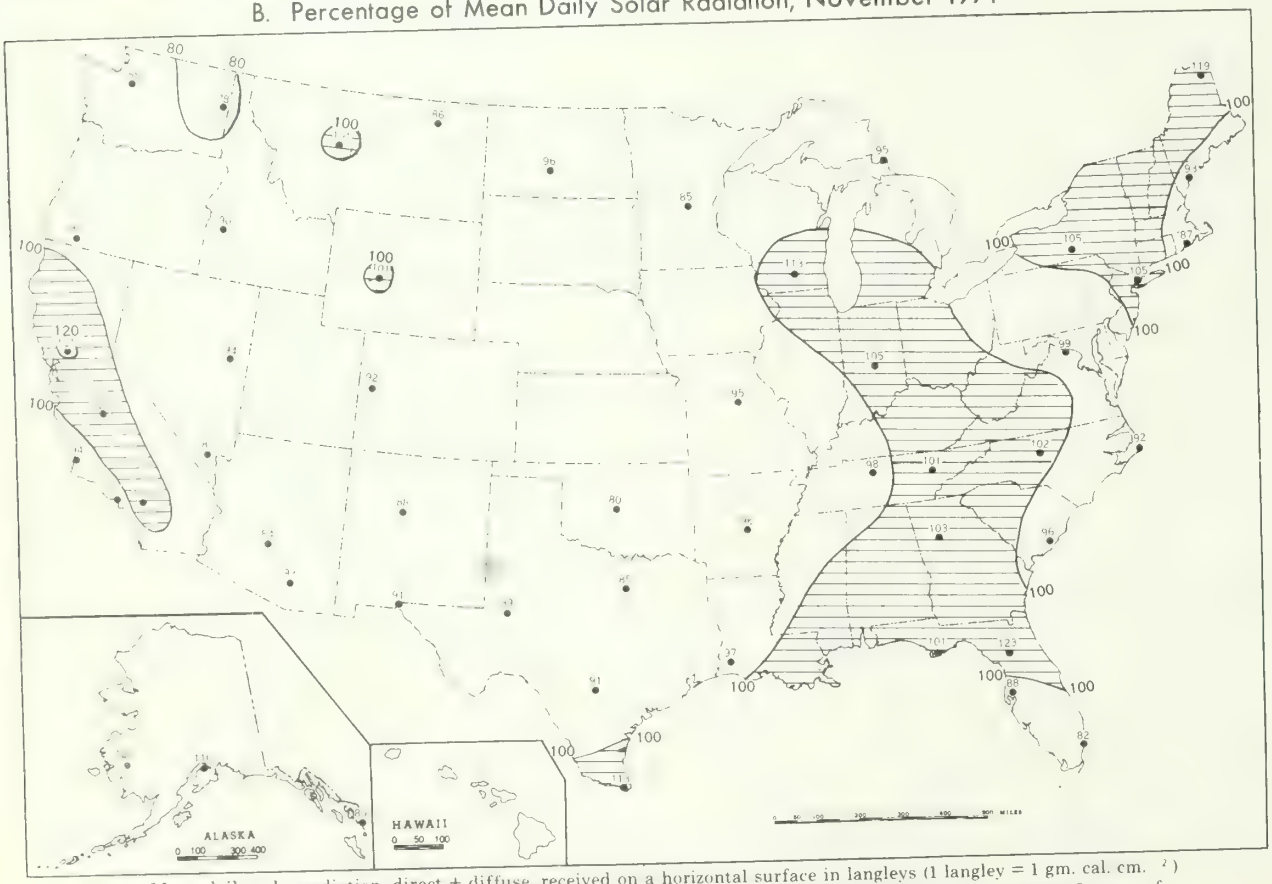


A. Amount of mean monthly snowfall is computed for **National Weather Service** stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. **e.s.t.**, of the Monday nearest the end of the month.
It is based on reports from **National Weather Service** and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, November 1971.

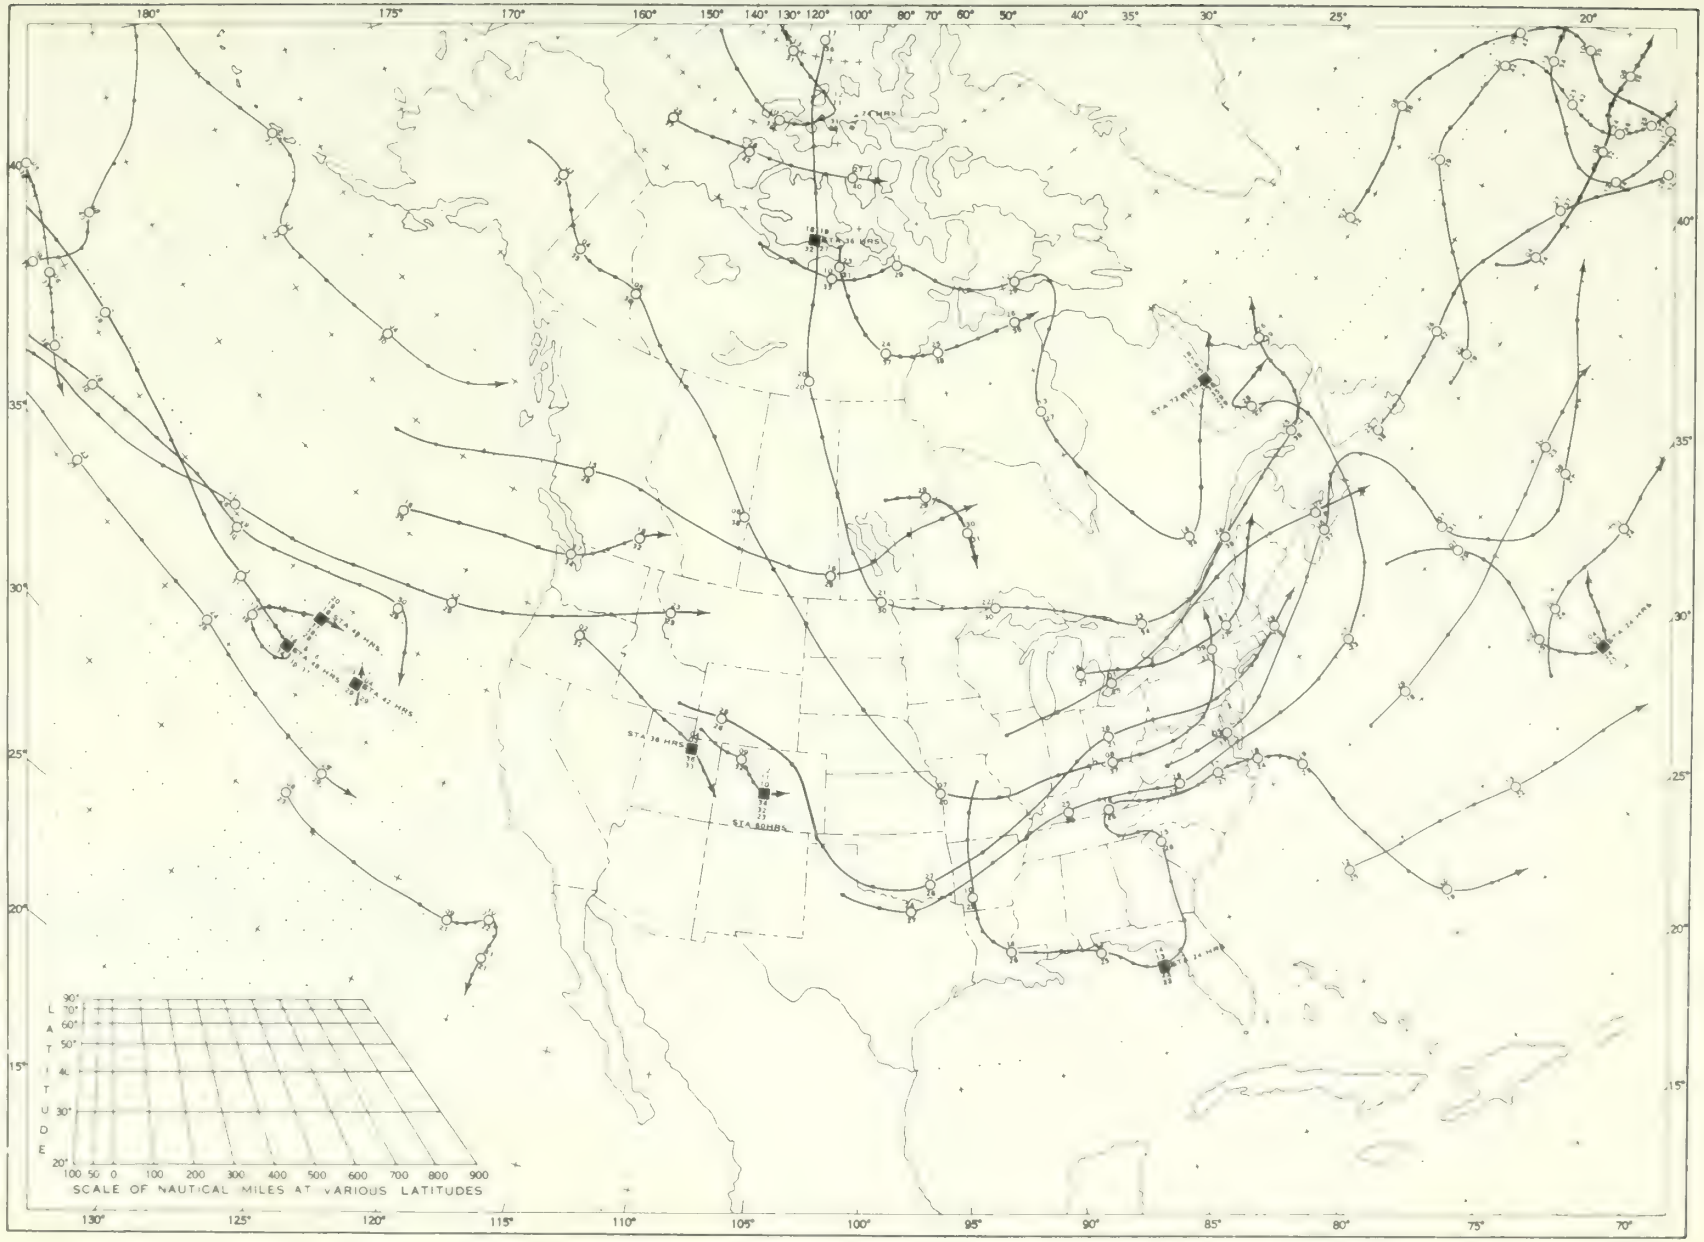


B. Percentage of Mean Monthly Sunshine, November 1971.

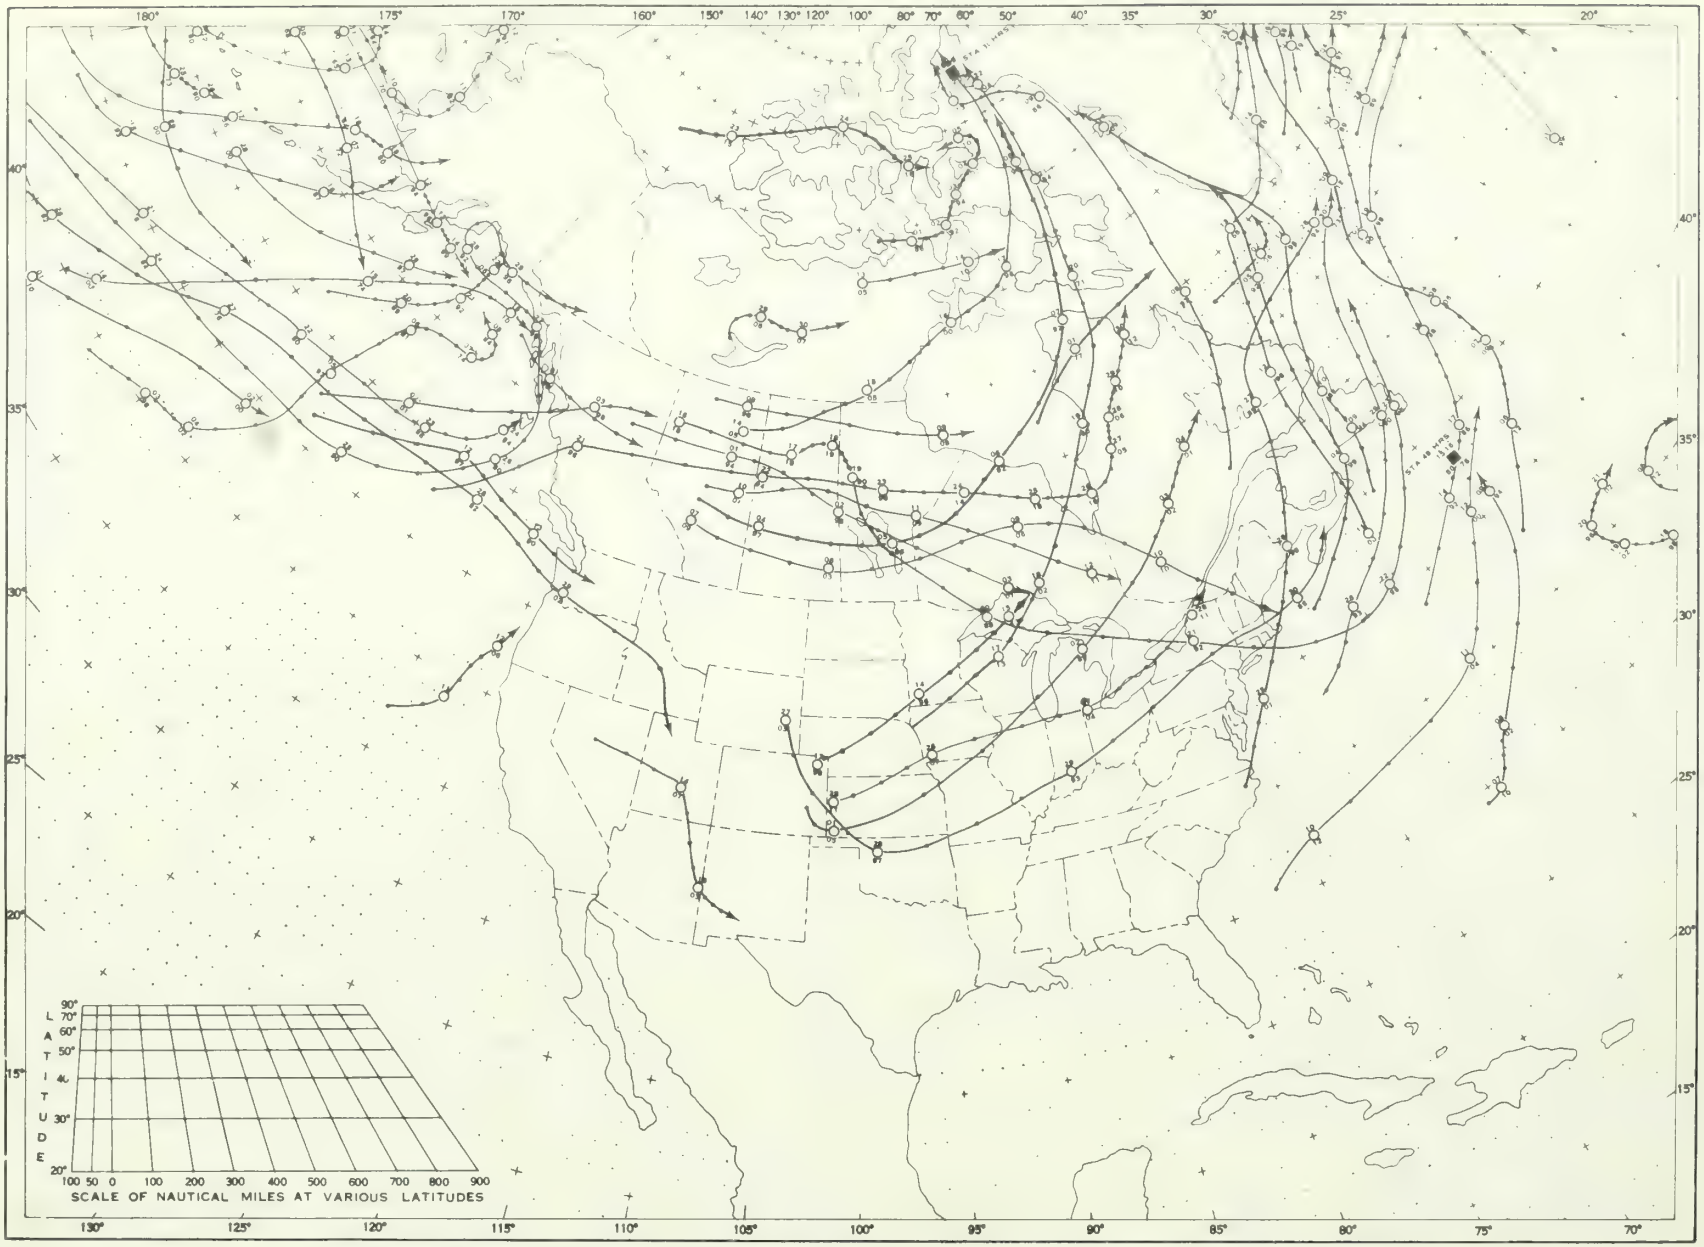


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, [illegible]

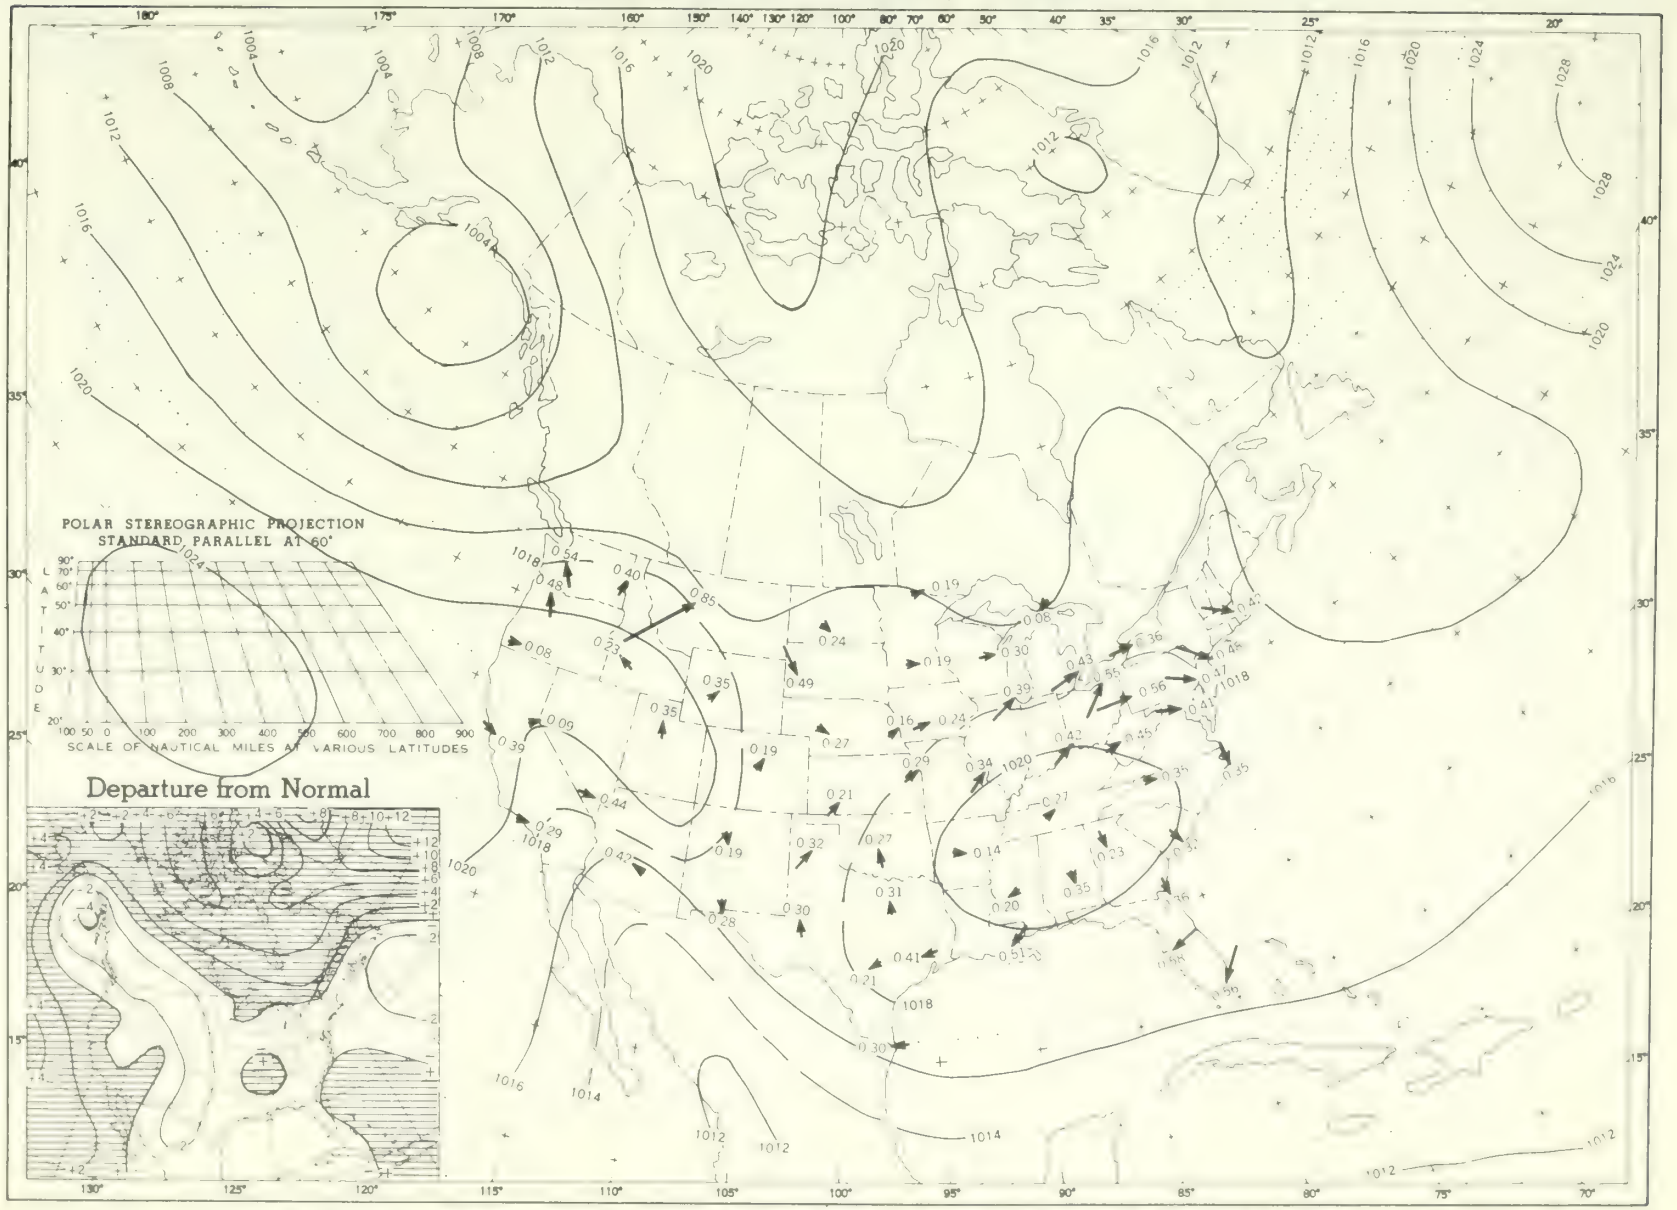


B. Percentage of Mean Daily Solar Radiation, November 1971



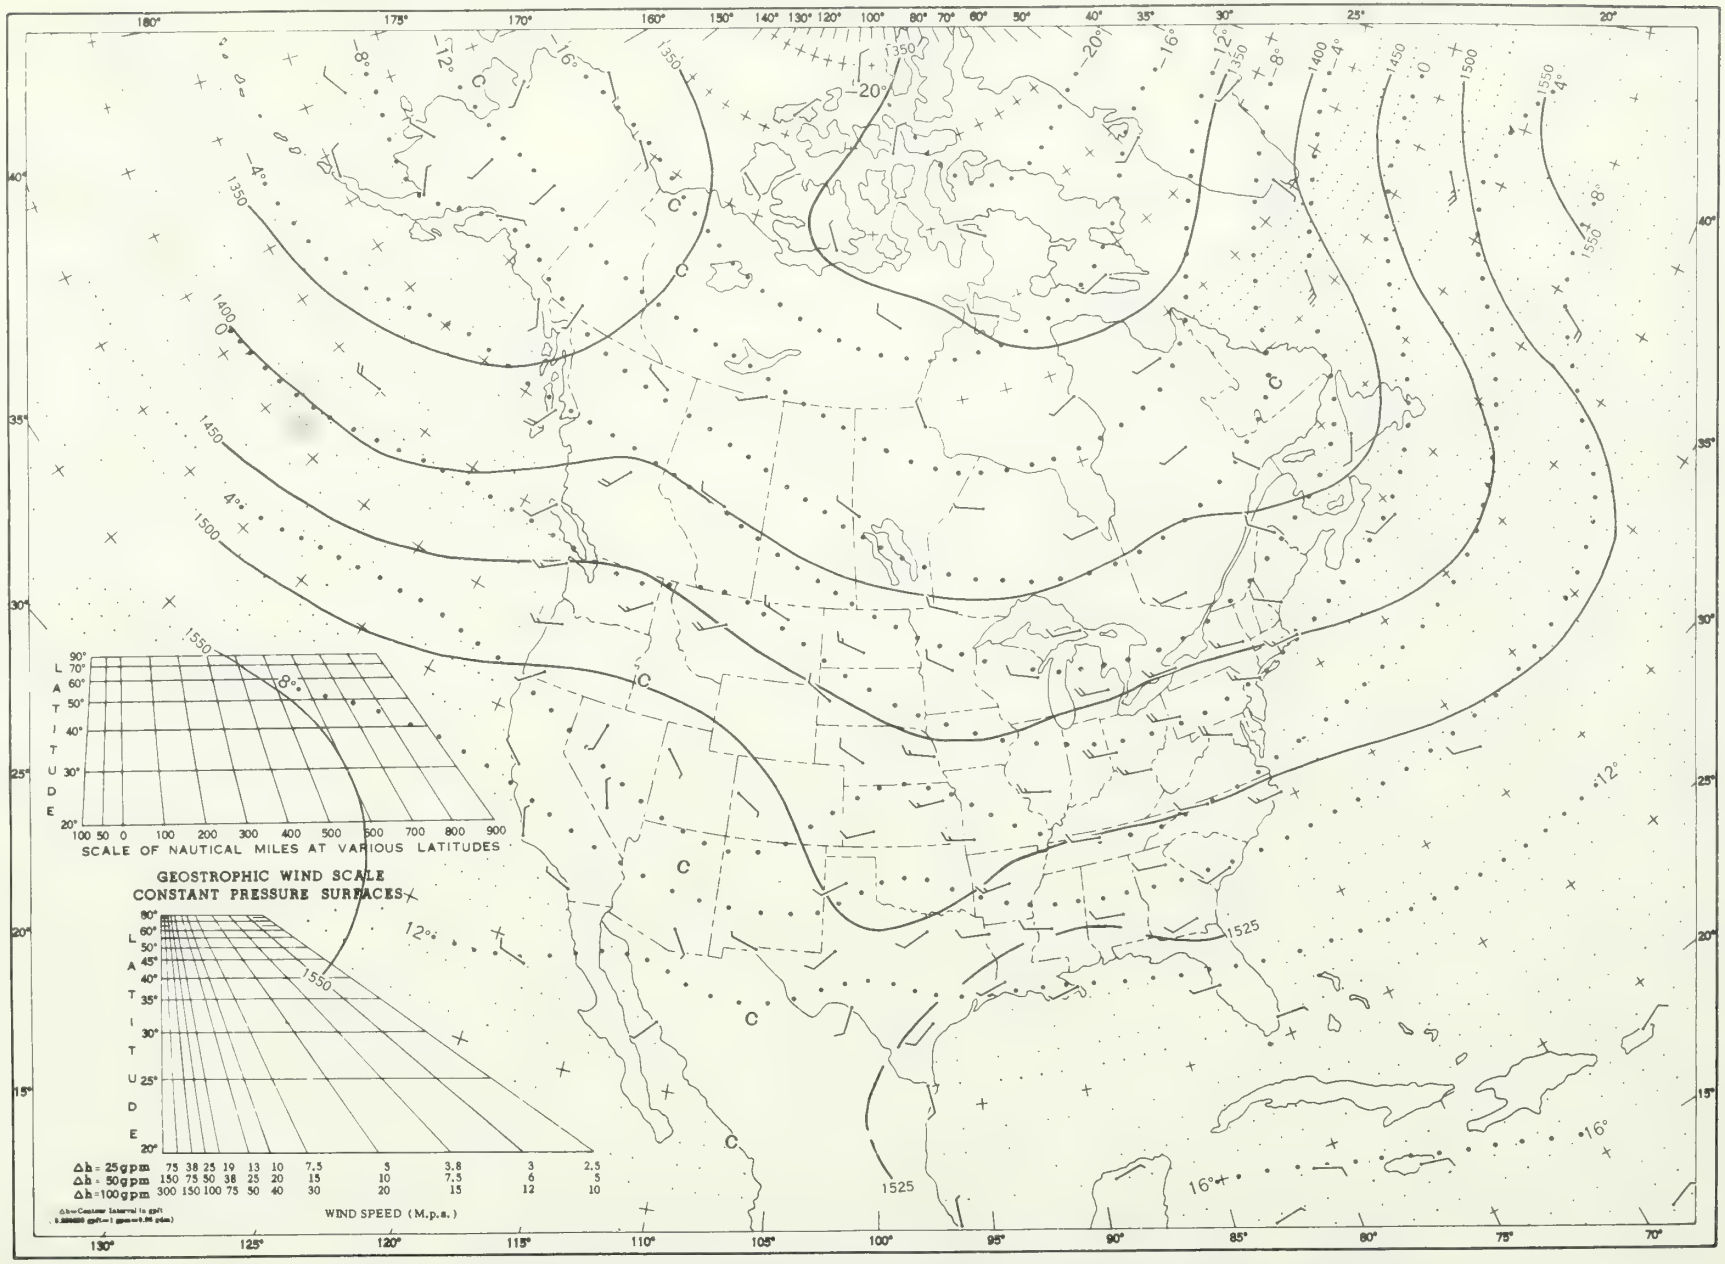
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, November 1971.



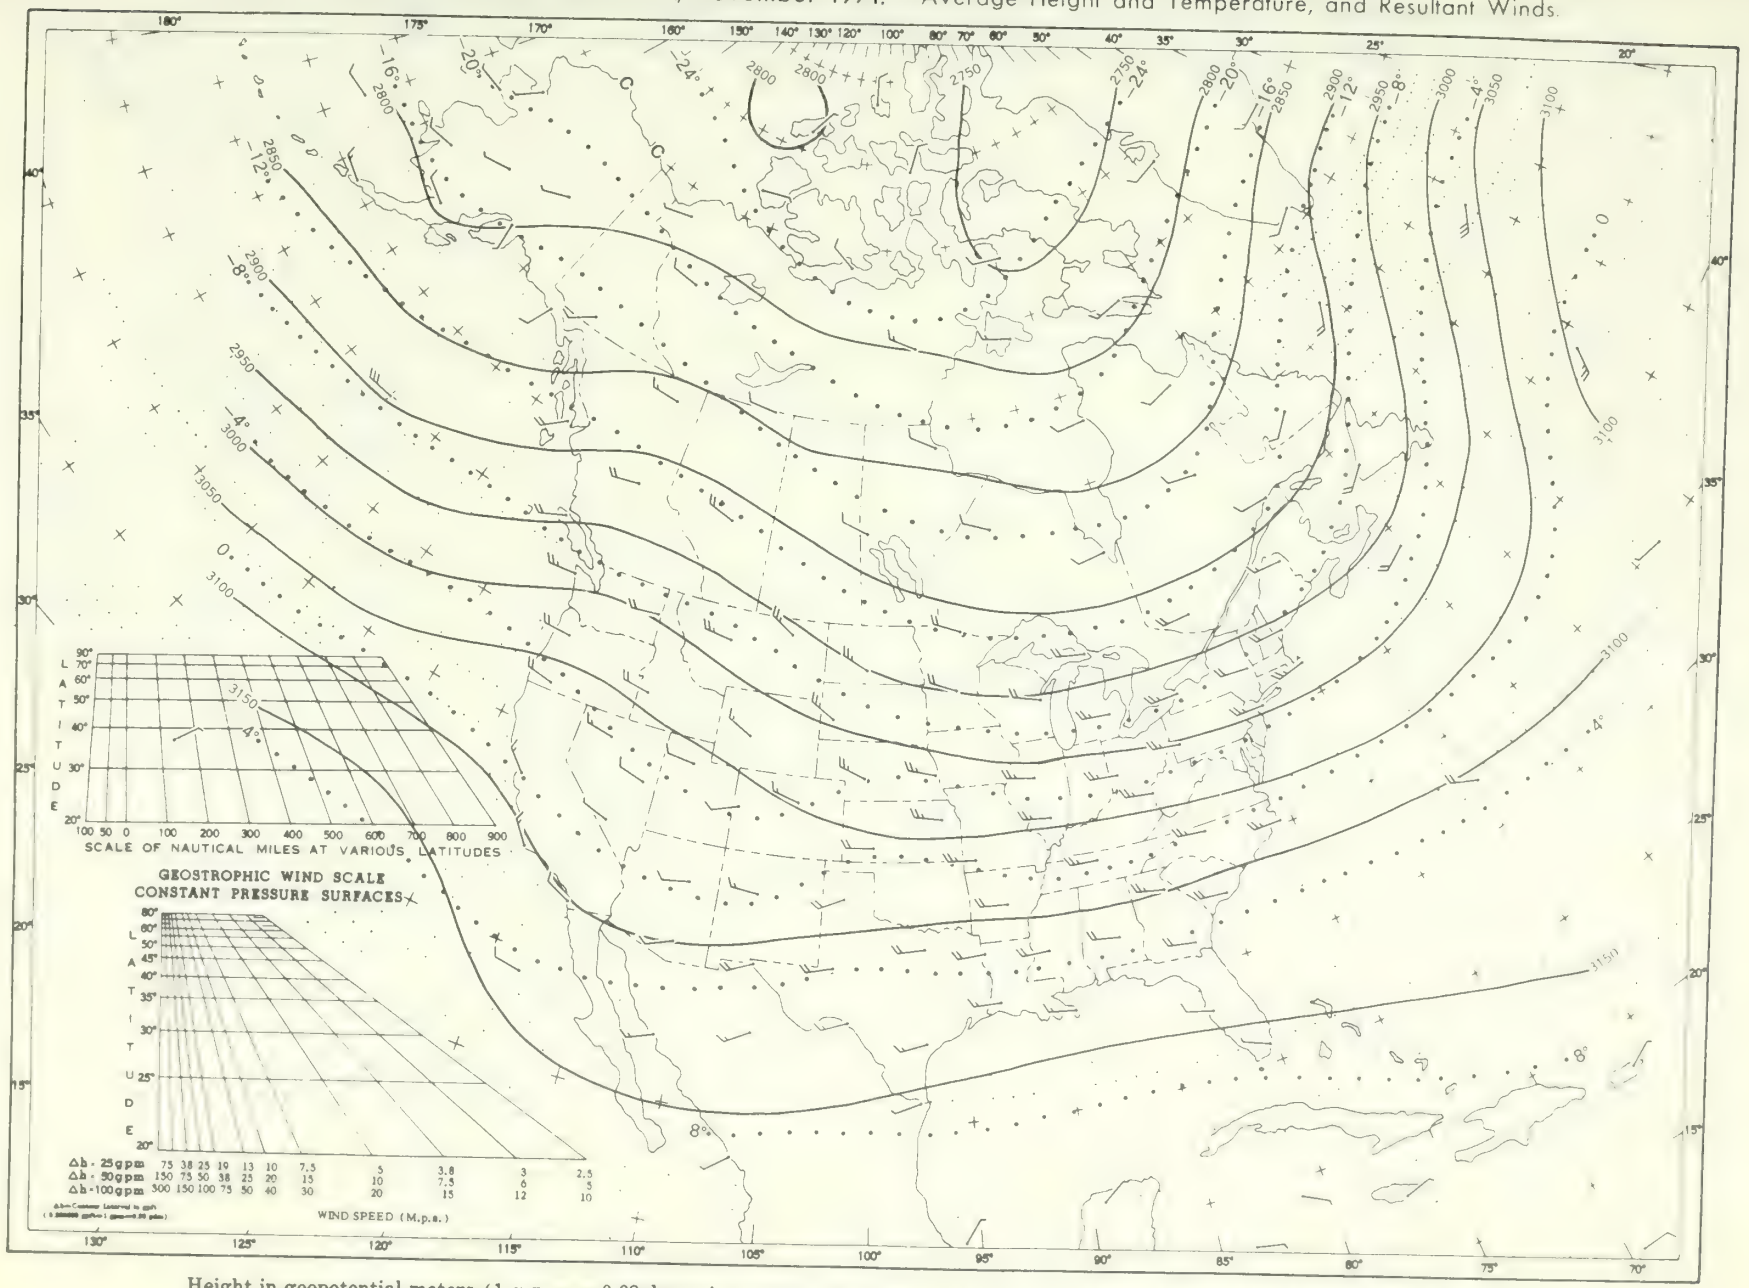
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar Dots indicate intervening 6-hourly positions Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included

Chart IX Tracks of Centers of Cyclones at Sea Level, November 1971.



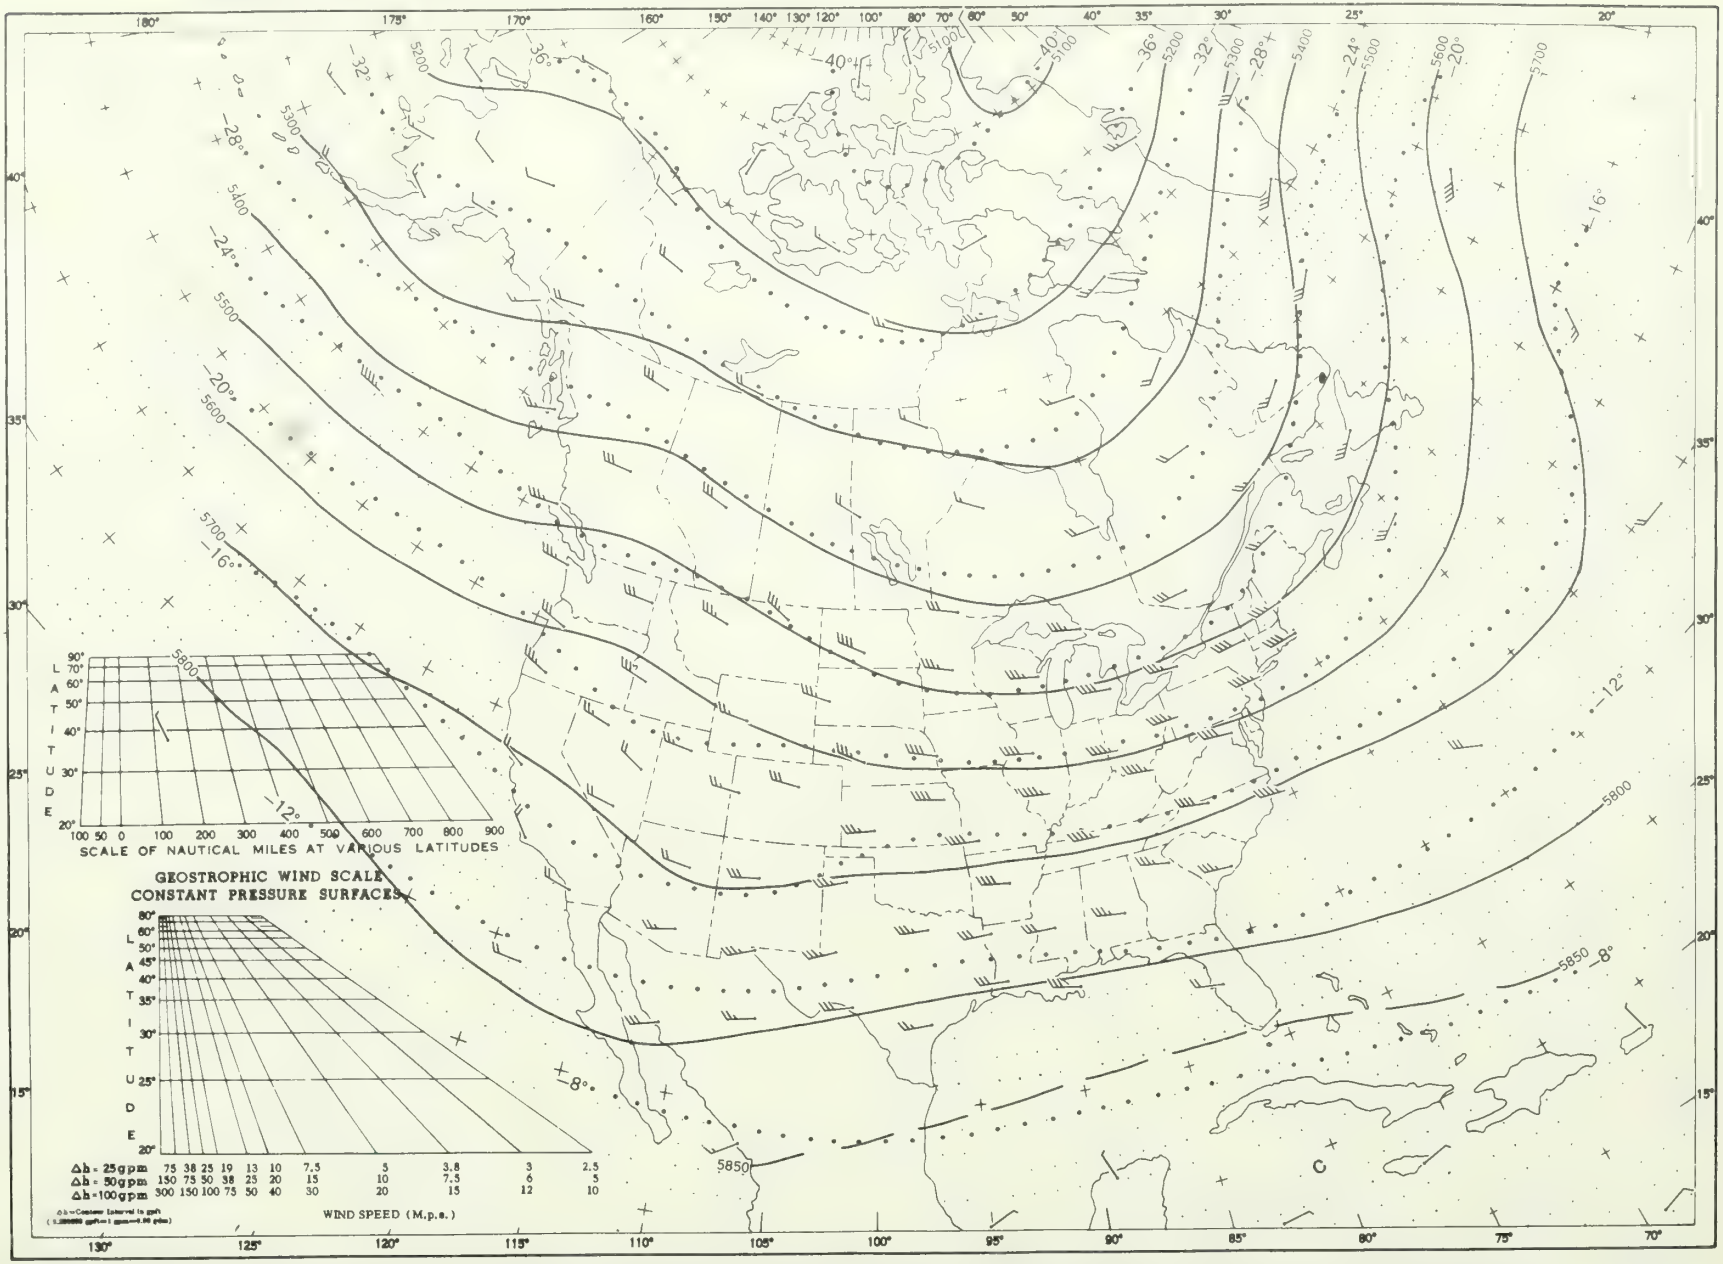
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, November 1971. Inset Departure of Average Pressure (mb) from Normal, November 1971.



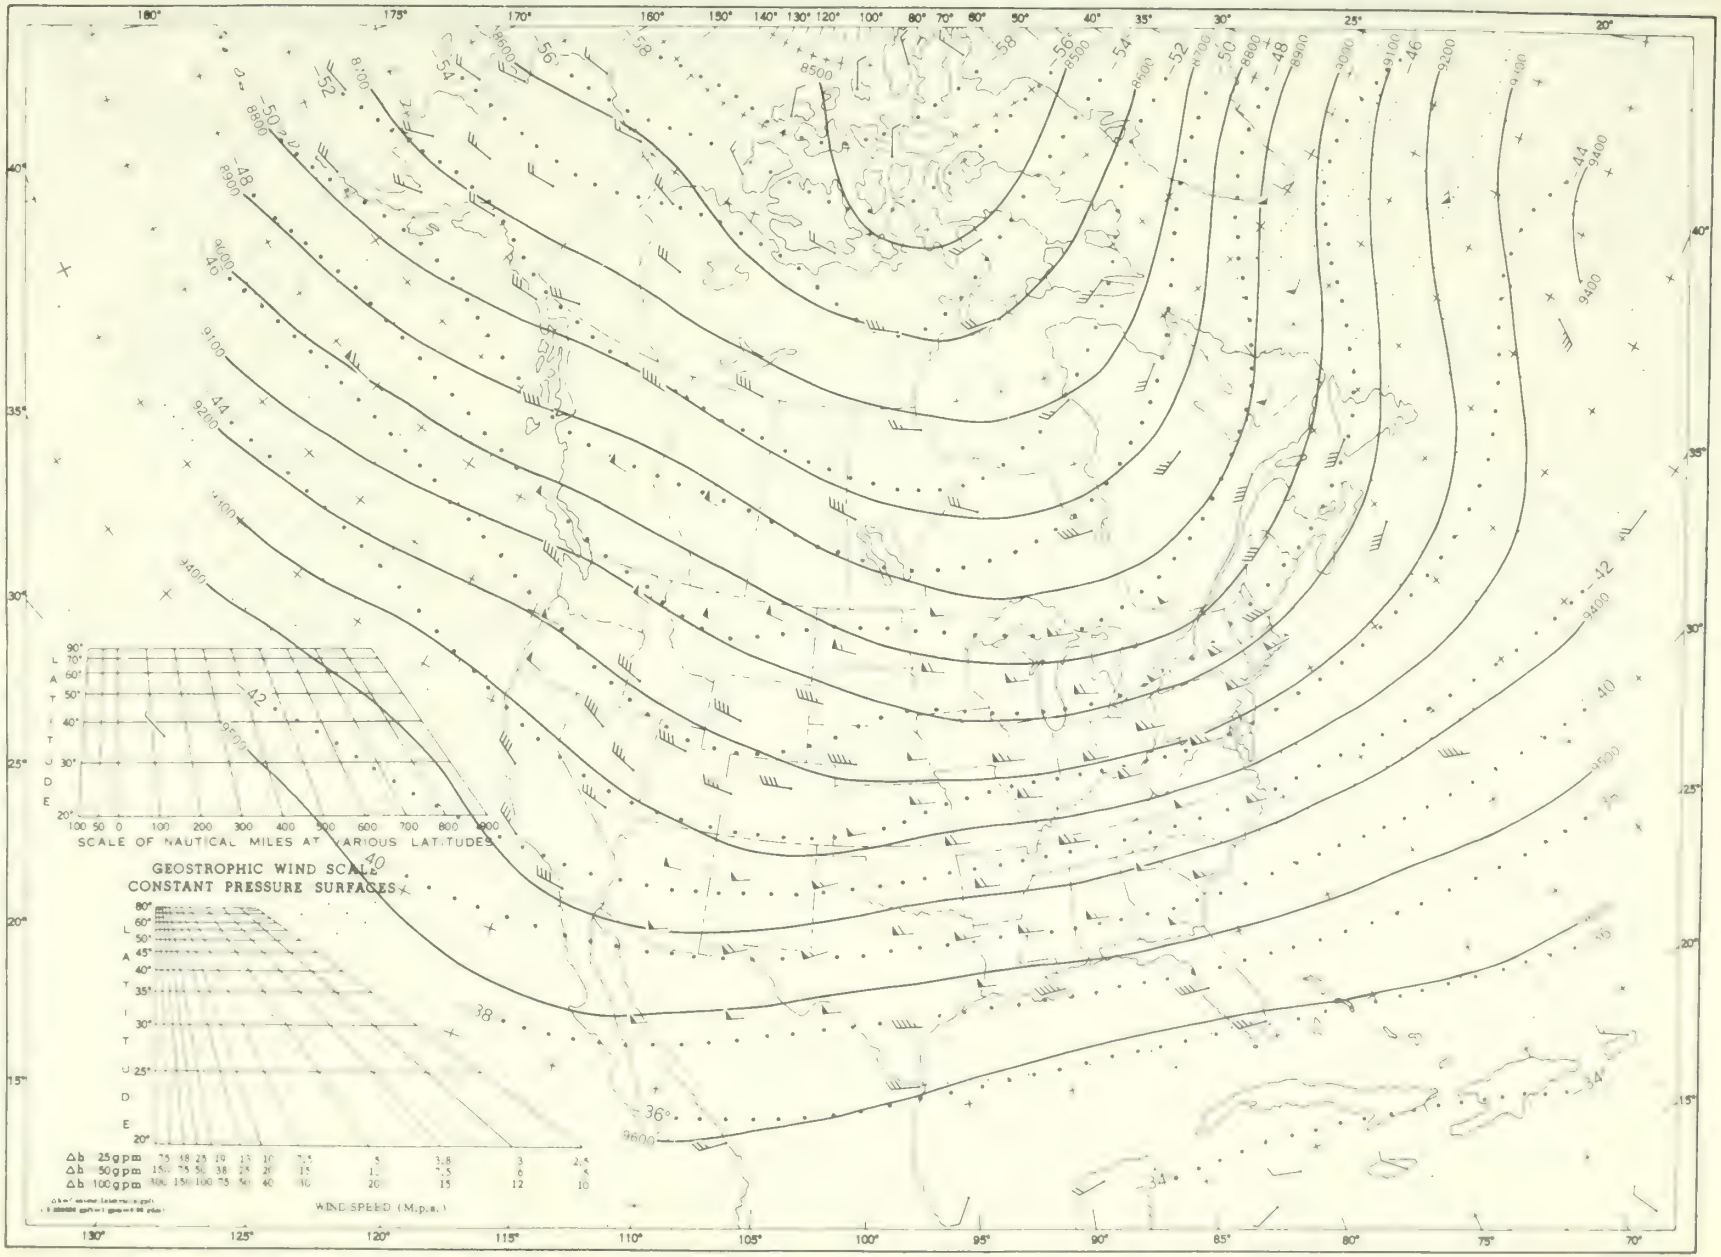
Average sea-level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed ÷ average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 G.m.t., November 1971. Average Height and Temperature, and Resultant Winds.



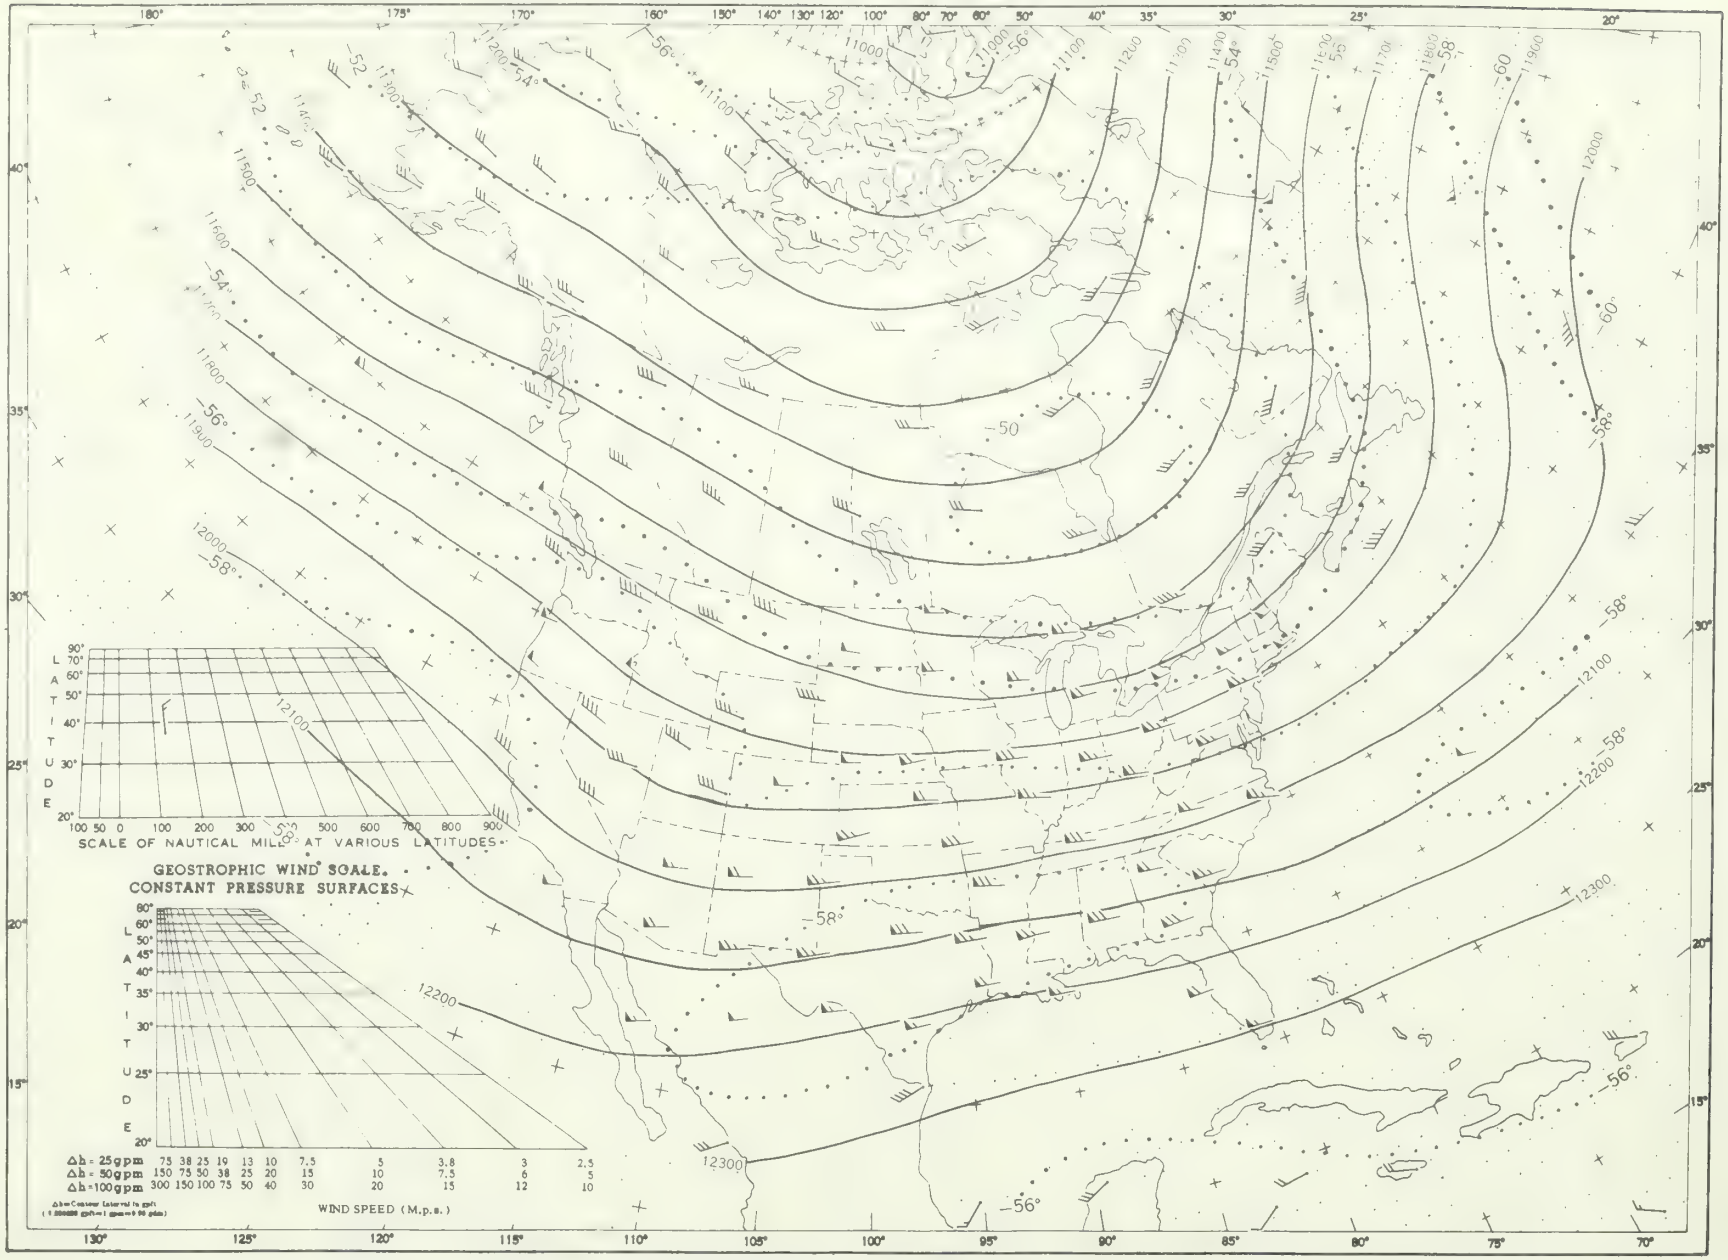
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 G.m.t., November 1971. Average Height and Temperature, and Resultant Winds.



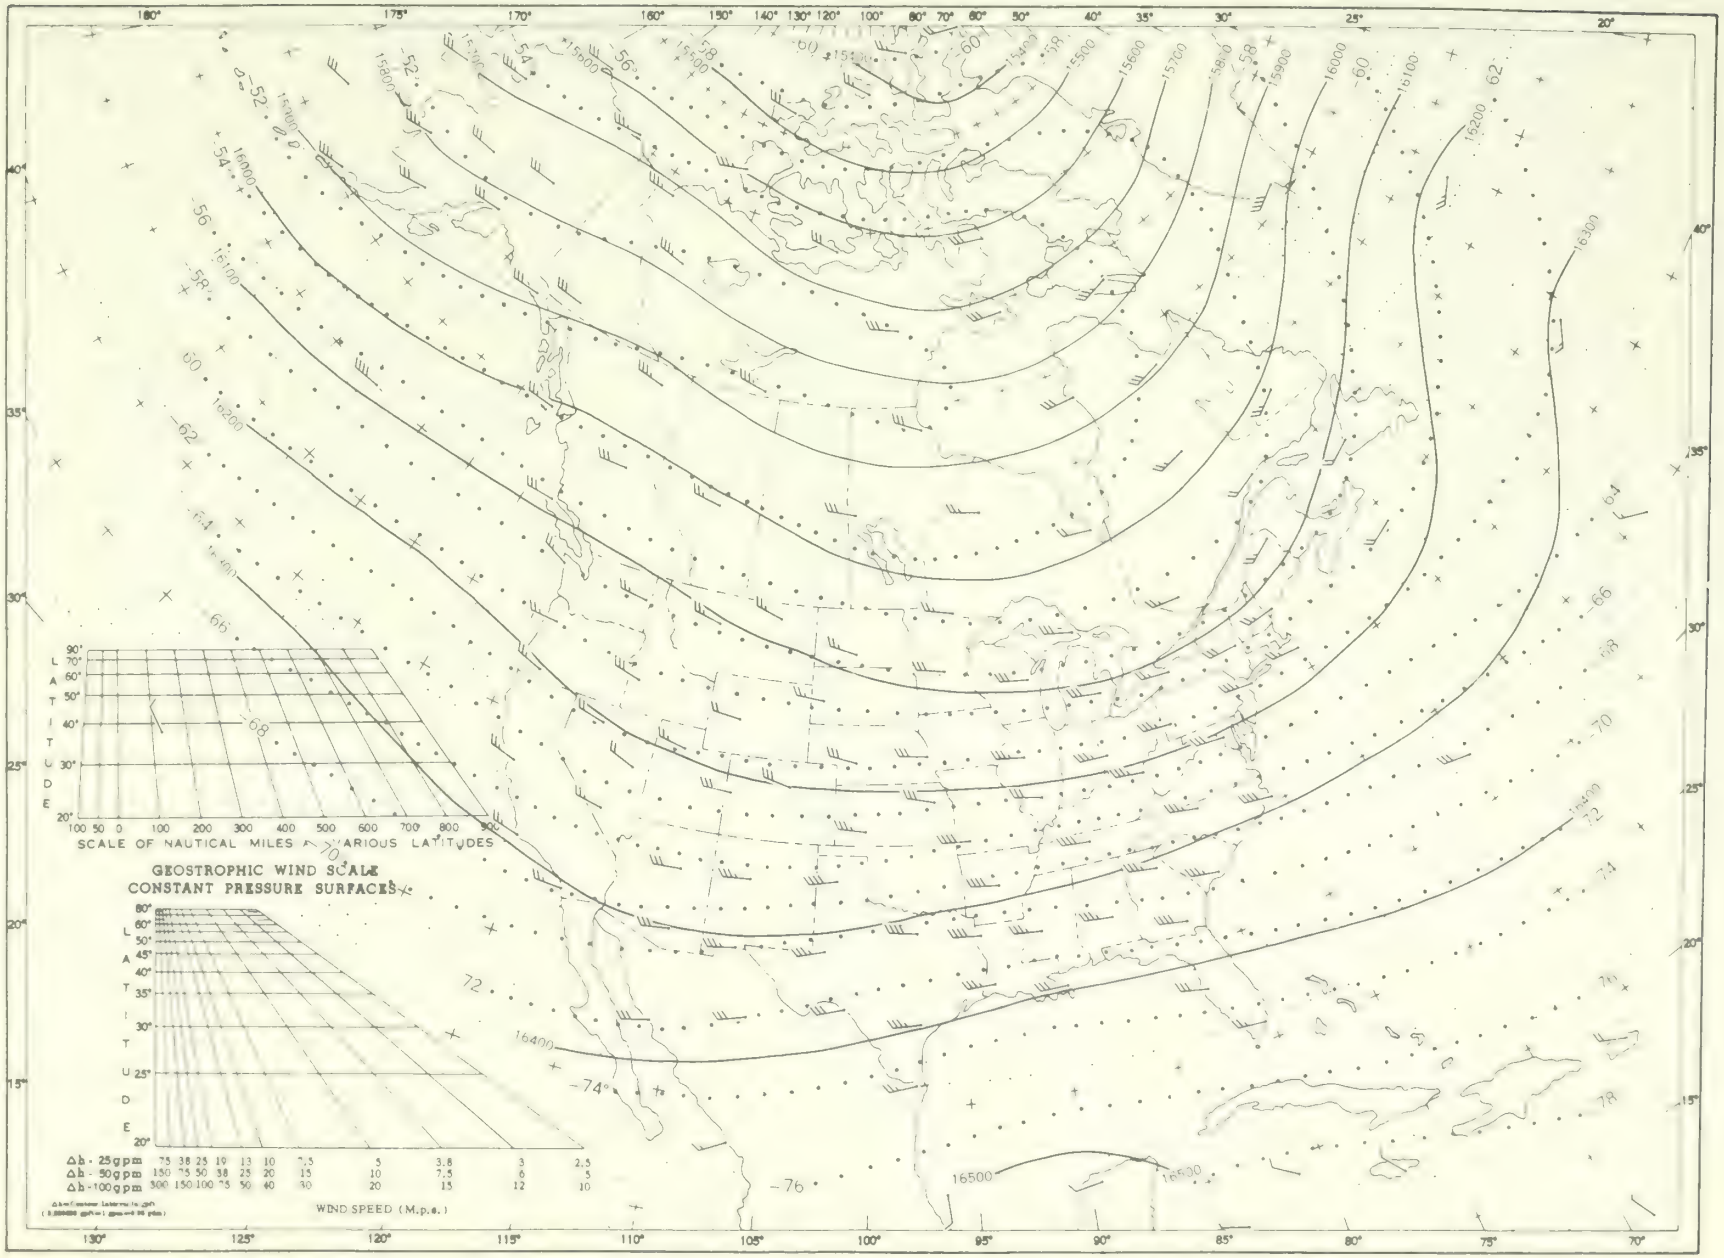
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 G.m.t., November 1971. Average Height and Temperature, and Resultant Winds.



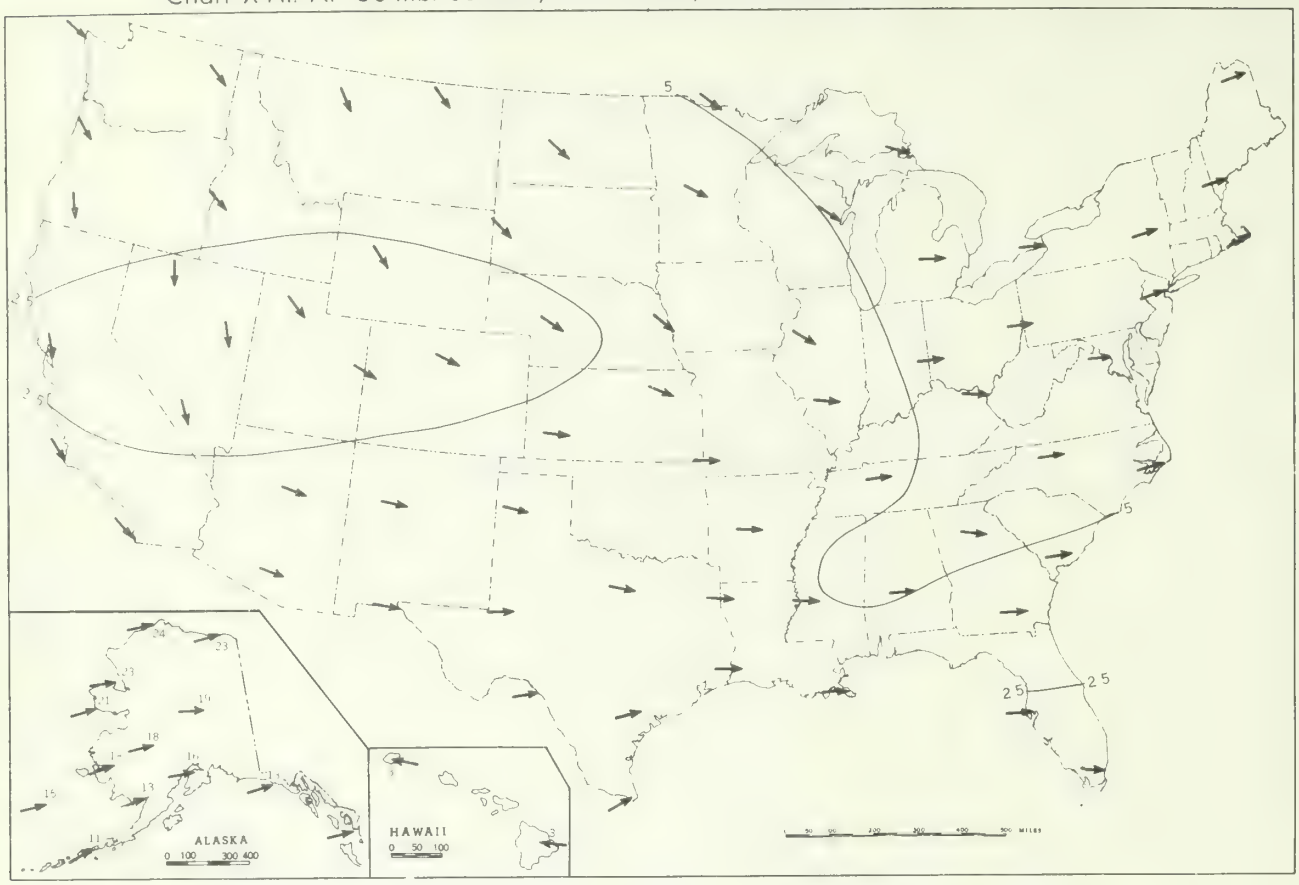
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV 300-mb Surface, 1200 G.m.t., November 1971. Average Height and Temperature, and Resultant Winds



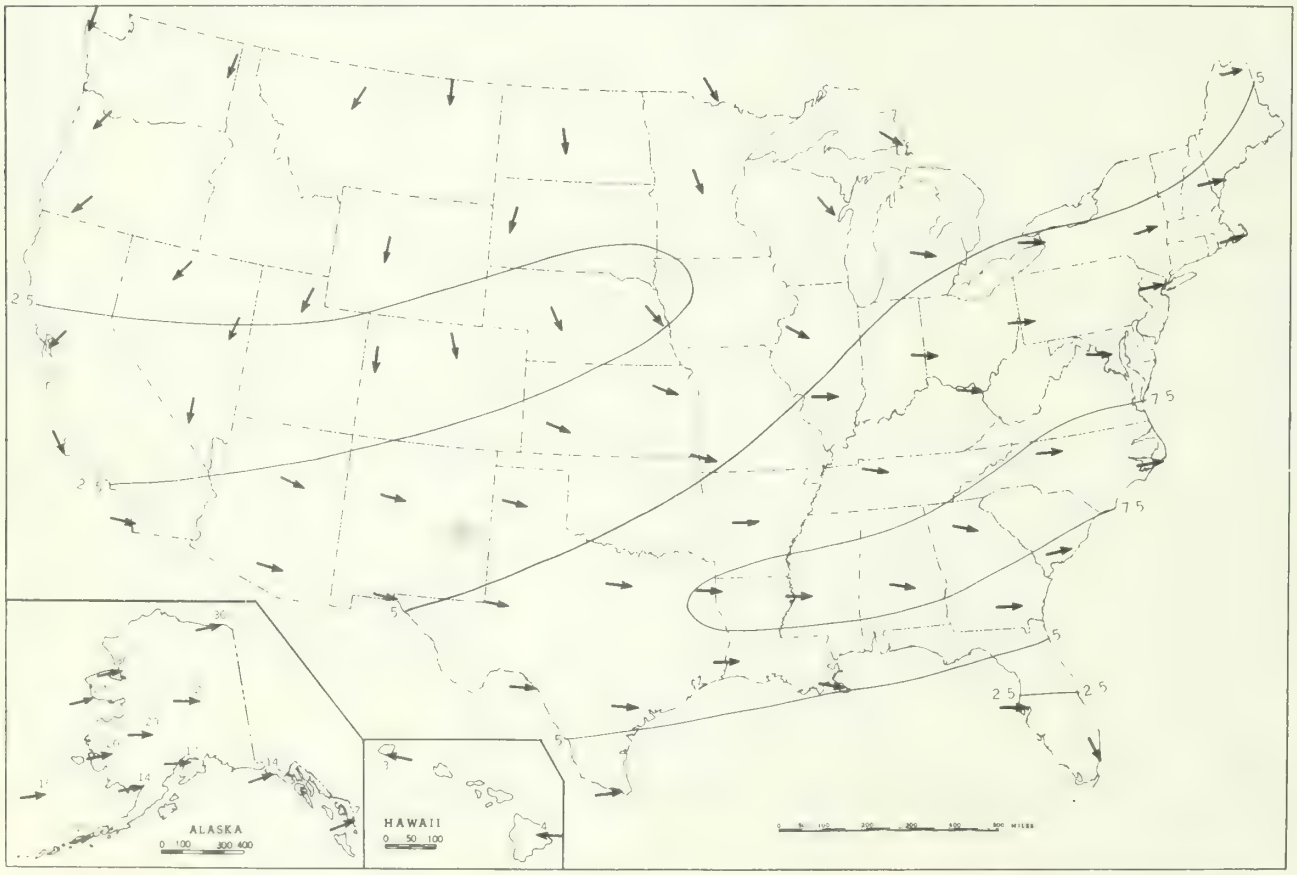
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb Surface, 1200 G.m.t., November 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI 100-mb Surface, 1200 G.m.t., November 1971. Average Height and Temperature, and Resultant Winds.



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVII. A. 50-mb. Surface, 1200 G.m.t., November 1971. Resultant Winds.

B. 30-mb. Surface, 1200 G.m.t., November 1971. Resultant Winds.

Volume 22 No. 12 DECEMBER 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Many locations in the East experienced the warmest December temperatures in the 20th century. In contrast, unusually cold weather predominated over the West.
2. December was unusually wet from the Great Lakes to the western gulf coast.
3. Heavy snow fell in the Cascades, the Rocky Mountains, and in northern New England.

TEMPERATURE (° F)--Cold temperatures prevailed over most of the nation at the beginning of December. Waterloo, Iowa, registered -5° and Hibbing, Minn., -4° on December 1. On the 2d, subzero weather was common over the northern portions of New York and New England. Boonville, N. Y., recorded 13° below zero on the morning of December 2. Subzero temperatures also occurred in several western and central states: Montana, Wyoming, Colorado, Minnesota, Wisconsin, and Iowa.

Bone-chilling cold continued over much of the West through the first 3 weeks of December. Parts of the Southwest averaged 15° colder than normal during that period. Mild weather came to the East in the second week of the month and continued to the end of the year. Baton Rouge, La., registered 83° and Ft. Myers, Fla., 84° on the afternoon of December 9. Savannah, Ga., warmed to 83° on the 11th; this is the highest December temperature of record for Savannah. Bridgeport, Conn., registered 65° on the same date. This is the warmest temperature of record for so late in the season at Bridgeport.

The Indian summer over the East was interrupted shortly after midmonth when a cold front pushed steadily southward. Subzero weather came to northern New England on the 19th. On the same date the mercury at Tallahassee, Fla., tumbled to 30°. Arctic cold continued its grip over the northern border States from Washington to Minnesota in the fourth week of December but mild southerly winds warmed mid-America and the East. Subzero chill prevailed over the Northwest, the northern Rocky Mountains, and the northern Great Plains in the last few days of December. Big Piney, Wyo., recorded -26° on the morning of December 28. Temperatures over the Southeast continued mild to the end of the year.

Many stations in the Southwest--California, Nevada, and Arizona--reported that December 1971 was the coldest December in several decades and one of the coldest of record. In contrast, numerous stations in the East recorded the warmest temperatures in several decades. At Trenton, N. J., December 1971 was the warmest December in the 20th century and the second warmest of record.

PRECIPITATION--December began with a mixture of snow, sleet, freezing rain, and freezing drizzle across much of the North and cold clouds and cold rain farther south. By December 2, a storm in the West was reaching major proportions. Gales whipped the coastal areas, rain fell along the coast, and heavy snow blanketed the Rocky Mountains. The storm dumped heavy snow over the southern Rocky Mountains and spread to the adjoining Great Plains. As the storm moved along the Gulf of Mexico coast, it dumped generous rains over the Deep South. The storm crossed the Florida Peninsula to the Atlantic Ocean. It produced combinations of cold rain, drizzle, snow, and sleet. The snow accumulated to depths of 18 inches or more at some mountain locations in the Carolinas. Storms brought a variety of inclement weather to much of the nation in the second week of December. Freezing rain and freezing drizzle iced the highways and coated the trees from Pennsylvania to New England. Heavy rains caused flash floods in the Lower Mississippi River Valley. Another storm raged in the western mountains. Snow reached depths of 10 to 12 inches in spots in New Mexico. A second western storm lashed the northwest Pacific coast with heavy rain and gales along the coast, and snow in the nearby hills and mountains. The strong winds whistled through the mountain passes and blizzards occurred in Montana east of the Continental Divide. Mixtures of snow, freezing rain, and freezing drizzle fell south of the snow belt. Tornadoes occurred in a half dozen or more Central States on December 15. A tornado caused one death at Springfield, Mo. Several persons of Poplar Bluffs, Mo., were injured by a tornado and tornadoes caused widespread damage in northeastern Arkansas.

A huge storm of the northern Pacific coast brought dismal weather to the Northwest in the fourth week of December. Flurries occurred over the northern Great Plains and eastward to the Great Lakes. Rain or drizzle mixed with fog reduced the visibility to near zero in some localities in the Middle Atlantic States.

In the closing days of the month, a Pacific storm moved southward bringing heavy rain to the already-soaked portions of southern California. Snow flurries occurred in the northern and central Rocky Mountains, the northern Great Plains, and eastward to New England. Freezing rain or freezing drizzle fell south of the snow zone and showers fell from the western gulf coast to the northern Appalachians.

December rainfall over a large area extending from north-central Texas to Lower Michigan was more than twice the normal precipitation. At Ft. Smith, Ark., the December total, 10.09 inches, was the greatest in the 89-year record. It was over 3-1/2 times the Ft. Smith normal. Long Beach, Calif., received 5.21 inches, the most December rain in 30 years. Snowfall records were broken at a number of places. Over 15 inches fell at Boise, Idaho. This exceeds the December amount for any of the last 20 years.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.
Z Sun continuously below horizon.

Data from airport unless otherwise specified U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

Z Sun continuously below horizon.

´ Includes crop damage.
C Crop damage.
* No occurrence of storms or unusual weather phenomena reported.
‡ Includes heavy sleet storm.
Freezing drizzle and freezing rain, commonly known as glaze.
Ø For breakdown of "All Others", and for detailed listing of other storms, see the Environmental Data Service, NOAA, monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS DECEMBER 1971

Elmer R. Nelson, Office of Hydrology

Major flooding occurred on tributaries of the Arkansas River in northeastern and extreme eastern Oklahoma during December. The Poteau River at Panama, Okla., rose nearly 15.5 feet above flood stage which was the fourth highest stage of record. Bird Creek and Polecat Creek crested 1 foot to 1.5 feet lower than the September 1971 flood. The Arkansas River experienced the most flooding since completion of the Arkansas River Navigation project. Flood damages were heavy and estimated at nearly $16 million.

The flooding along the East Fork of the Trinity River near Crandall, Tex., was the second highest since records began in 1949.

Serious flooding and landslides occurred in southern California during the latter part of December. The damages were estimated at $3.5 million.

HUDSON BAY DRAINAGE

Red River of the North - Precipitation amounts were light over the Souris Basin during December, ranging from a trace to 0.26 inch. Snow depths at the end of the month ranged from 1 inch to 4 inches over most of the basin, except 8 inches over the Turtle Mountains along the Canadian border.

Monthly precipitation totals ranged from 0.08 to 0.86 inch over the Red River of the North Basin. Snow depths at the end of the month ranged from 2 to 4 inches over the North Dakota tributaries and the central portion of the Basin. In the Minnesota portion of the Basin, snow depths ranged from 10 inches over the upper portion (Otter Tail and Wild Rice) to 5 to 7 inches in the lower basin (Thief River and portions of the Red Lake River).

Drainage of earlier precipitation continued with nearly all tributaries of the Red River flowing above normal for the month of December.

ST. LAWRENCE DRAINAGE

Lake Erie - Minor flooding occurred on the St. Mary's River at Decatur, Ind., on December 15-17. No damage was reported.

Lake Ontario - Heavy precipitation (about 1 inch) towards the end of December caused a rise in the Genesee Basin but no flooding along the main streams. Two to three inches of snow occurred in the southern half of the valley, followed by freezing rain. Some water crossed route 258, west from Groveland flats in the lower Canaseraga Creek Basin. No damage was reported.

ATLANTIC SLOPE DRAINAGE

Average precipitation for the Delaware River Basin above Trenton, N. J., during December was 3.18 inches or 98 percent of normal. Only a few stations in New York State reported precipitation amounts over 4 inches during the month. The Delaware River Basin below Trenton averaged around 1.4 inches or about 40 percent of normal. Precipitation averaged 1.6 inches or 48 percent of normal over northern, central, and southern interior sections of New Jersey. The snow cover averaged 8 to 11 inches in the upper third of the Delaware Valley in the beginning of December. The heaviest snow depth reported was 18 inches at Pleasant Mount, Pa. Very mild weather from the 10th to the 17th reduced the snowpack to 3 inches or less by the 12th and mostly to a trace by the 18th. In the upper portions of the Delaware Valley, light snows at the end of the month produced a snow cover that ranged from 1 inch to 3 inches on December 31.

The 13 principal water-supply reservoirs in New Jersey were at 99 percent of total capacity at the end of December. Due to snowmelt and normal December precipitation, New York City's three reservoirs on the upper Delaware increased storage by 66.4 billion gallons during December and were at 67 percent of capacity by the end of the month.

The Lumber River at Lumberton, N. C., rose to flood stage on the 6th and remained at flood stage through the 8th. The main flooding in South Carolina during December was along the Broad River from the North Carolina-South Carolina state line downstream to Columbia, S. C., the Congaree Basin below Columbia and the upper Saluda. The important feature of the flooding on the Broad River was that it remained above flood stage at Blair for 4 days. Moderate flooding occurred in the Congaree Basin below Columbia to St. Matthews. Storage in Lake Greenwood prevented flooding of the Saluda River on downstream. The flooding was due to 1 inch to 3.5 inches of rain plus snowmelt on the 6th-8th. Eight to sixteen inches of snow occurred over northwest South Carolina and adjacent North Carolina on the 3d. Flood damages were light.

Heavy rains during the early part of the month caused minor flooding on the middle and lower Savannah and Ogeechee Rivers in Georgia. Additional release of water from the Hartwell and Clark Hill Dams, to bring pool levels down to normal, was responsible for part of the high water on the Savannah River, especially the latter part of the month. Damage is estimated to be light.

EAST GULF OF MEXICO DRAINAGE

Locally heavy rains during the first and third weeks of December caused two periods of flooding on the Apalachicola River at Blountstown, Fla. The first flooding began on the 8th and continued to the 11th with a crest 2.4 feet above flood stage. The second overflow occurred on the 23d through the 25th with a crest 1.5 feet above flood stage. The total damage was estimated at $21,200 by the Corps of Engineers.

Heavy rain (2 to 4 inches) on the 6th-7th caused minor flooding on the Cahaba River at Centreville, Ala., on the 7th. Damage from the overflow was negligible.

Minor flooding occurred on the Tombigbee River at Coffeeville Lock and Dam, Ala., on the 9th-12th. Only minor damage resulted from the 2.5-foot overflow. This flooding was due to rains averaging nearly 3 inches on the 6th preceded by 2-inch rains on the 2d.

Rainfall in Mississippi was exceptionally heavy during December. Amounts ranged from 3 inches over the northern delta area to over 17 inches at a few locations in southwest Mississippi. Rain fell almost every day during the first 3 weeks of the month. Heavy rainfall during the first week of December produced rapid rises on streams to near or slightly above flood stage by the 10th. The continuing rains kept streams at, near, or above flood stage the rest of the month. Lowland flooding occurred along the Pearl and Leaf Rivers. Widespread lowland flooding occurred on the Bogue Chitto River where a stage of 16.35 feet (flood stage, 11 feet) was reached at Franklinton, La., on the 9th. Farming and timber cutting operations were at a standstill for most of the month. Scattered flash flooding occurred as drainage was slowed down by the already bankfull streams. Over 6.5 inches of rain occurred in a short period on the 6th, flooding drains and hampering traffic in the Brookhaven, Miss., area.

Trash moving downstream on the Bogue Chitto River washed out a bridge near Clifton, La. Considerable damage occurred to some secondary roads in the area of overflow. The total flood damages in Mississippi and Louisiana were estimated at $776,400. There were no reports of injuries or fatalities attributed to the flooding.

MISSISSIPPI SYSTEM

Upper Mississippi Basin - Precipitation was near normal over Minnesota and above, to much above normal, over Wisconsin during December. Snow cover at the end of the month ranged from 4 inches to near 20 inches with the greatest depths over the St. Croix, Chippewa, and mid-Mississippi Basins. Ice jams occurred at several locations on the Mississippi River with some overflow reported in the Monticello-Coon Rapids, Minn., area on the 23d. Ice jams were also reported on the Chippewa River at Durand, Wis ., on the 27th-30th and on the Wisconsin River at Portage, Wis., on the 22d-30th with a 5-foot rise at each location.

Heavy precipitation (2 to 4 inches) on the 13th-14th caused flooding along the Sangamon and Kaskaskia Rivers in Illinois and along the Meramec River at Pacific, Mo. Crests were generally 1 foot to 3 feet above flood stage except on the Sangamon River at Riverton, Ill., where it was nearly 8 feet above flood stage.

Mississippi River navigation for the 1971 season ended at St. Paul, Minn., on Dec. 7 and at Guttenberg, Iowa, on December 16.

Missouri Basin - Temperatures in South Dakota during December averaged below normal, but with no prolonged cold spells. Precipitation was above normal over the eastern two-thirds of South Dakota and adjoining areas and below normal in the western one-third of the State. Two snowstorms occurred during December. The first, on the 7th-8th, deposited 6 to 10 inches of snow in north-central South Dakota and the other on the 29th-30th, produced 2 to 7 inches of snow over the eastern half of the State. At the end of December, snow depths were 4 to 10 inches in northwest Iowa, 1 inch to 6 inches in northeast Nebraska, 6 to 9 inches in southwest Minnesota and 2 to 12 inches in the eastern two-thirds and northwest South Dakota. In southwest South Dakota there was little snow on the ground at lower elevations, with up to 1 foot in higher elevations in the Black Hills and eastern Wyoming. Streams were frozen over in the upper Missouri Basin except the main stem which was half or more covered with shore and floating ice. Missouri River navigation ended on the 4th.

Flooding in the Missouri Basin during December was confined to small streams in the lower portion during the middle of the month. The overflows were due to heavy precipitation during the evening of the 14th and the morning of the 15th. Showers and thunderstorms over a large portion of Missouri, much of the eastern half of Kansas, and extreme southern Iowa produced heavy rains ranging from 1.5 to 4 inches. Flash flooding occurred around the Metropolitan Kansas City, Mo., area as well as in other portions of west-central and central Missouri. Most larger streams rose to near bankfull or above. The Little Blue River at Lake City, Mo., rose 6.5 feet above flood stage. Several roads or county highways were closed temporarily due to the high water. Little loss resulted as flooding was confined to agricultural lowlands where most crops had been harvested. The Petite Saline River and Moniteau Creek in central Missouri rose to near bankfull stage toward the end of the month due to heavy rains on the 29th.

Heavy rainfall (2 to 4 inches) on the 13th and 14th caused some flooding along the Osage River and its tributaries in Missouri. Flooding was minor except moderate on the Osage River at Schell City, Mo., and on the Marmaton at Nevada, Mo. No flood damage was reported.

Ohio Basin - It was a very warm and wet month in the upper Ohio Basin in Pennsylvania during December. In parts of the Allegheny Basin, rainfall was over twice the December normal. Daily temperature at Pittsburgh, Pa., averaged 8° above normal and the monthly precipitation was 0.92 inch above normal. Rainfall was above normal in the Beaver, Youghiogheny, and Ohio River Basins but below normal over most of the Monongahela Basin. A moderate rise occurred on the upper Allegheny River and a strong rise on the Clarion River on the 30th and 31st. The Clarion River at Ridgway, Pa., exceeded flood stage on the 30th. No damage resulted as the river channel at Ridgway was improved several years ago.

December was a very wet month over most of Indiana. Several 24-hour totals exceeded 1 inch at one or more points around the 8th, 15th, and 30th. The total precipitation recorded at Indianapolis, Ind., was 6.02 inches, or more than twice the normal. Nearly all the precipitation was in the form of rain. Minor flooding occurred in the Wabash Basin from the 15th through the 22d. No damage was reported.

Five to over six inches of rain in the headwater area of the French Broad Basin in North Carolina on the 6th-7th caused flooding along the mainstem at Rosman on the 7th and at Blantyre, N. C., on the 7th-10th. This rain coupled with melting snow, produced some flash flooding in Transylvania and Henderson Counties. Up to 20 inches of snow fell at the higher elevations of the mountains on the 2d. The saturated ground prolonged the flooding at Blantyre. No damage was reported from the flooding.

Light flooding was reported on South Chickamauga Creek near Chickamauga, Tenn., on the 7th and on the main stem of the Tennessee at Whitesburg, Ala., on the 8th-10th. No damage was reported.

White Basin - Record flooding occurred on the Buffalo River at Gilbert, Ark., on the 10th. It rose from a stage of 4.9 feet at 7 a.m. on the 9th to a record crest of 44.0 feet at 5 p.m. on the 10th, or a rise of 39.1 feet in 34 hours. This flooding was due to excessive rain (8 to 10 inches) on the 8th-10th. Widespread local and flash-flooding and some flooding occurred on the Black, Cache, and White Rivers. The Black River was above flood stage at Black Rock, Ark., from the 11th to the 13th. The crest on the 12th was 4.7 feet above flood stage. The Cache River at Patterson, Ark., was above flood stage from the 12th to the 21st.

The main stem of the White River was above flood stage at Calico Rock, Ark., for a few hours on the 11th. The crest was 6.25 feet above flood stage. Downstream at Batesville, Ark., the crest was 7 feet above flood stage on the 12th. One person was drowned when her car stalled in floodwaters from the Middle Fork of the White River in Washington County, Ark.

Arkansas Basin - Flooding occurred between the 9th and 21st on the major tributaries of the Arkansas River in northeastern and extreme eastern Oklahoma and along the main stem of the Arkansas in the reach from Van Buren to Morrilton, Ark. Overflows ranged from around 2 feet above flood stage on the Illinois, Little Caney, and Caney to nearly 15.5 feet above flood stage on the Poteau River at Panama, Okla., where it reached a stage of 39.4 feet. This was the fourth highest stage of record at

Panama. Upstream at Poteau, Okla., the crest was 8.5 feet above flood stage.

Bird Creek and Polecat Creek crested 1 foot to 1.5 feet lower than the September 1971 flood. Crests on Bird Creek ranged from 6 feet above flood stage at Avant, Okla., to 7 feet above flood stage at Sperry and Owasso, Okla. The crest on Polecat Creek at Sapulpa, Okla., was more than 5 feet above flood stage. This flooding was due to 5 to 9 inches of precipitation on the 9th-10th.

The Arkansas River experienced the most flooding since completion of the Arkansas River Navigation project. The crests on the 10th-11th in the Van Buren-Morrilton, Ark., reach ranged from 4 to 5 feet above flood stage. Navigation was suspended on the 10th-15th due to the high water.

Flood damages in eastern and southeastern Oklahoma were heavy. Homes, farms, small businesses, livestock, roads, bridges, sanitation systems, and sewers suffered the heaviest damages from the high water. The Tulsa World newspaper estimated the damages at nearly $16 million. Due to the dormant growing season, damages were negligible along the Little Caney, Caney, Neosho, and Illinois Rivers.

Red Basin - Major flooding occurred during December in portions of the Red River and its tributaries in southeastern Oklahoma, Little River and its tributaries in southwestern Arkansas and the Sulphur River in northeast Texas. The greatest damage occurred along the Rolling Fork and Cossatot Rivers, where damages were estimated at $1.5 million. Damages along tributaries of the Little River were estimated at $80,000. Minor flooding occurred on the Red River at Arthur, Tex., on the 10th-11th. This flooding was due to heavy rain which ranged from 8 inches in northeast Texas to 13 inches at Vandervoort in Polk County.

Lower Mississippi Basin - Minor flooding occurred on the St. Francis River at Fisk, Mo., on the 13th-21st and at St. Francis, Ark., on the 19th-22d. This flooding was due to heavy rains that averaged over 3 inches, with 5-inch totals in the upper reaches early in December. No damage resulted from the overflow.

Heavy rainfall during the first week in December produced a rapid rise on the Big Black River to above flood stage at West, Miss., on the 7th. Continuing rains kept the stream above flood stage until the 25th. The crest on the 19th was nearly 6 feet above flood stage. Farming and timber cutting operations were at a standstill most of the month.

WEST GULF OF MEXICO DRAINAGE

Heavy rainfall during the first 3 days of the month caused the Calcasieu and Mermentau Rivers in Louisiana to rise above flood stage on the 3d-6th. Very heavy rain on the 6th caused sharp rises on both streams. Flooding continued on the Mermentau at Mermentau, La., until the 22d and on the Calcasieu at Hineston, La., to the 24th. There was considerable loss of pastureland for cattle grazing as large areas of the coastal plain remained under water for a prolonged period. There was some loss to the local trapping industry and minor economic loss due to water erosion of local roads.

Major flooding occurred along the Sabine River in northeast Texas beginning on the 6th and continuing into January at Mineola, Gladwater, and Longview, Texas. Cattle and machinery were moved out of the river bottom to higher land so no damage was reported.

Flooding occurred on the Elm Fork at Carrollton, Tex., and along the Trinity River from Dallas to Moss Bluff, Tex., during December. The overflow along the East Fork near Crandall, Tex., was the second highest since records began in 1949. It began overflowing on the 6th and reached a crest stage of 21.25 feet on the 10th. This was 1.6 feet lower than the highest stage of record (22.81 feet) which occurred on May 28, 1957. The total damages along the East Fork were estimated at $150,000.

Minor flooding occurred on the Elm Fork at Carrollton, Tex., on the 9th and on the Trinity River at Dallas, Tex., on the 6th. Heavy rains on the 8th-9th caused additional flooding at Dallas on the 9th-12th with a crest of nearly 9 feet above flood stage on the 10th. Flooding moved downstream to Long Lake, Tex., by the 11th and to Liberty, Tex., by the 15th where it continued above flood stage to the 31st. Damages along the Trinity River from Dallas to Long Lake were estimated at $797,000. Eighty-five homes were partially flooded in south Dallas according to the Dallas Office of Civil Defense. A special bulletin by the National Weather Service on the 9th urged evacuation of the Roosevelt Heights section in south Dallas. Richland Creek near Richland, Tex., crested near 22 feet, which was 2 feet above flood stage, on the 10th and Chambers Creek near Corsicana, 4 feet above flood stage on the 11th.

Minor flooding occurred on the Navasota River on the 7th-19th. Damages, if any, were light.

Heavy rains during the first few days of December caused minor flooding on the Navidad River at Ganado, Tex., on the 6th-9th. Some flooding occurred on the Guadalupe River south of Victoria on the 7th-10th. No damage was reported.

GULF OF CALIFORNIA DRAINAGE

Colorado River - Local flooding occurred in Tucson, Ariz., on the 4th and in southern Navajo County along the Mogollon Rim on the 26th. The latter overflow was due to heavy rains and snowmelt.

Minor flooding was reported north of Winslow, Ariz., on the Little Colorado River, on the 26th.

GREAT BASIN

Warm weather and moderate rain in late December, over a substantial snow cover in the upper Sevier Basin, caused minor flooding from Panguitch to Junction, Utah. The Sevier River overflowed its banks late on the 25th and by early the next morning a ditch had to be cut to prevent flooding in Circleville, Utah. No damage estimates are available.

The Great Basin was generally cold, windy, and wet during December. Most stations in Utah, southwest Wyoming, and western Colorado received above normal precipitation during the month. Some areas reported over 200 percent of average.

PACIFIC SLOPE DRAINAGE

Southern California - A series of storms in southern California on December 22-28 produced heavy rainfall and toward the end of the period, heavy snowfall in the mountains.

A 40-minute period of heavy rain in the Summerland-Carpenteria-Montecito area in Santa Barbara County caused a rush of water, rocks, and mud down the following creeks. Santa Monica, Romero, Franklin, Carpenteria, arroyo Parita and Toro, including the east and west branches. Several homes were flooded with water and mud. U. S. Highway 101 was closed for about 5 hours and California Highway 192 was closed for weeks. California 192 is the alternate highway for that area.

In Los Angeles County, numerous catch basins were

flooded. Several homes in Carson and Torrance, Calif., were flooded, mainly due to trash obstructing drains. This is not unusual in winter rains. The Pacific Coast Highway was closed for a short period due to mud slides which damaged a few homes. There was a small earth slide above Sylmar in a canyon where the earthquake of February 9, 1971, had loosened the earth.

Runoff in San Bernardino, Ventura, San Diego, Orange, and Riverside Counties was very light. No significant damage was reported in these counties.

The heaviest damage reported was in Santa Barbara County where the total loss was estimated at $3.5 million. There was no loss of life.

Coquille Basin - Moderately heavy precipitation on the 6th and 24th caused minor flooding on the Coquille River at Myrtle Point, Oreg., on the 6th-7th and 24th. There were no protracted periods of heavy precipitation although more than 4 inches was reported at some coastal locations. Freezing levels rose briefly to 10,000 feet on the 5th but stayed relatively low during the second rainy period. Some river bank erosion siltation and road damage resulted from the high water.

Columbia Basin - Heavy rains over the north Oregon coast and northern Willamette Valley on the 4th caused near bankfull stages on some Oregon coastal streams and near or above bankfull on most Cascade Range Willamette tributaries. Minor rises were noted on Coast Range Willamette tributaries. On the east side of the Cascades more than 1 inch of precipitation occurred at Pendleton, Oreg., and near 2-inch amounts in the surrounding area. Heavy runoff occurred in the low elevation Wildhorse Creek drainage and other normally dry canyons causing the Umatilla River to rise sharply to 0.1 foot above flood stage on the 6th.

Continued precipitation on the 10th-15th kept flows high in all parts of the Willamette Basins with the more sluggish Coast Range tributaries remaining over bankfull until mid-month. Little or no precipitation on the 16th-20th permitted all streams in western Oregon to recede toward base flow levels.

Heavy precipitation on the 20th-24th over the coastal drainages and Coast Range Willamette tributaries produced minor rises on the west side of the Coast Range and above bankfull stages on several streams on the Willamette side. The Marys and Luckiamute Rivers crested above bankfull stage on the 22d and 24th. The Tualatin River at Farmington, Oreg., exceeded flood stage by 2 feet at midnight on the 25th-26th. The South Yamhill River near Whiteson, Oreg., had twin crests above flood stage on the 23d (38.7 feet) and 24th (39.0 feet). Very little change was noted along the main stem Willamette during this period.

The Corps of Engineers estimated the damages in western Oregon at $322,000 and east of the Cascades, at $2,000.

Note: All observations scheduled at 1200, G. c. t. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Dew Point averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Dew Point data are not published for standard pressure surfaces for which less than 5 observations are available. Dew Point data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature and dew point in degrees Celsius, and resultant winds in tens of degrees and meters per second.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

\+ Observations for these stations are scheduled at 0000 G. c. t.

† Dew Point temperatures are based on a minimum of 5 observations. Therefore, due to the lesser number of Dew Point observations at the surface and higher levels comparison with dry-bulb temperatures should be made with care. Dew Point temperatures replaced Relative Humidity January 1967.

SOLAR RADIATION INTENSITIES

Tabulated in langleys per minute on a surface normal to the direction of the sun. DECEMBER 1971

Langley is the unit used to denote one gram calorie per square centimeter. An Explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION TOTALS

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

Station	Day of month

Note.--Langley is the unit used to denote one gram calorie per square centimeter. Values with an asterisk are interpolated.

The solar radiation data in this table form the basis for the analyses in Charts VII, A, and B, of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

1 Indicates Urban sites

NET RADIATION

Net radiation in langleys per day (8 a.m. to 8 a.m.) at Palmer, Alaska. DECEMBER 1971

Date	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys	- 85	- 64	- 78	-111	- 25	- 26	- 48	- 44	-139	- 78	-121	- 28	- 52	- 34	- 23	- 29	- 20	- 19	-150	-163	-149	- 79	- 11	- 12	- 20	- 17	- 82	- 97	- 84	- 76	- 57	-67

He measurement is made with a CSIRO FUNK net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Palmer Exp. Station. The instrument with which they were measured has not been checked by the NOAA, National Weather Service.

SOLAR ULTRA-VIOLET RADIATION DATA

Daily totals and monthly average (< 3900 Å) at Ames, Iowa

Date	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys								1.11	5.28	2.43	3.75	4.97	3.45	1.72	2.64	4.97	5.79	5.38	2.94	2.03	4.77	3.25	2.23	3.55	1.42	3.04	3.25	5.08	2.13	0.50	0.29	3.67

These data are from an E - V Eppley total ultra violet sensor and Speedmomax H (Leeds Northrup) Recorder. It is at the same location (Agronomy Building, Iowa State University, Ames) as the published total solar radiation instrumentation. This instrument has not been checked by the NOAA, National Weather Service.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code A S Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
	Data not received in time for publication.																															

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick. The code A S designates the type of measurement made

Note. - Langleys is the unit used to denote one gram calorie per [illegible] centimeter.

Values with an asterisk are interpolated.

U Indicates Urban sites.

Tucson is corrected by a factor of 1.2 from July 1971 on.

The solar radiation data in this table form the basis for the analyses in Charts VII, A, and B, of this publication. The analyses include adjustments required to bring station records to approximately the same level of calibration.

TOTAL OZONE DATA — LATE REPORTS

[illegible] data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code [illegible] described in the report entitled TABULATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA

[illegible]

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertica[illegible] column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of [illegible] standard pressure and temperature. [illegible] ozone implies an ozone layer 0.[illegible] centimeter thick. The code [illegible] designates the type of measurement made.

STORM SUMMARY REPORT - LATE REPORTS

MARCH 1971

NEW JERSEY — WINDSTORMS: Damage to Property - 5

JUNE 1971

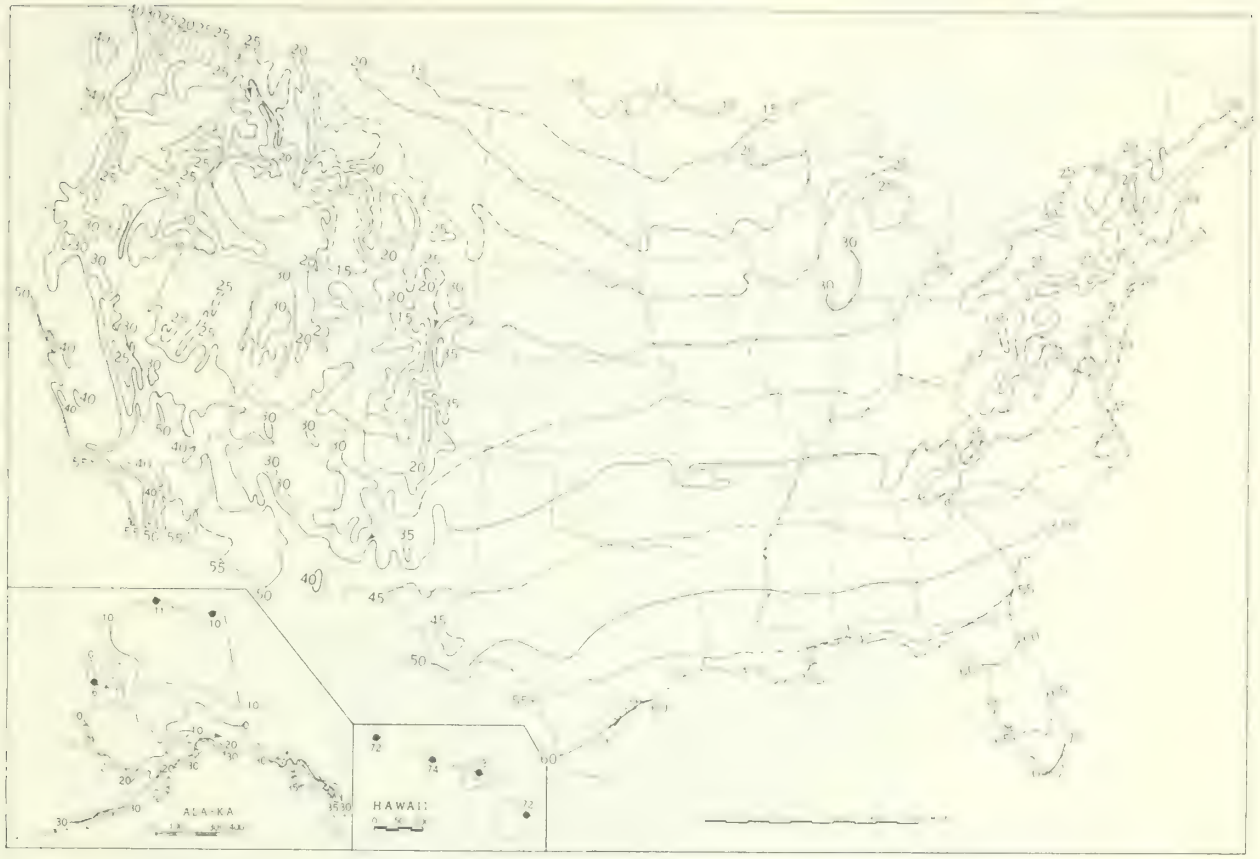
MISSISSIPPI — TORNADOES: Number - 2, Days - 2, Damage - 5; HAILSTORMS: Damage to Property - 3, Damage to Crops - 4;
WINDSTORMS: Deaths - 1, Injuries - 2, Damage to Property - 5, Damage to Crops - 3
LIGHTNING: Deaths - 2, Damage to Property - 5

CORRECTIONS

Annual 1969 — General Summary of Tornadoes, Table 2, Page 53, Total deaths should be 19.
Month: August 1969
General Summary of Tornadoes, Table 2, Page 53, Total deaths should be 0.
Month: September 1969

February 1971: Louisiana — Storm Summary: Total number of deaths should be 11.

February 1971: Mississippi — Storm Summary: TORNADOES: Number - 20, Days - 4, Deaths - 117, Injuries - 1,521, Damage - 7; HAILSTORMS: Damage to Property - ?; WINDSTORMS: Injuries - 1, Damage to Property - 5; LIGHTNING: Damage to Property - 4; HEAVY SNOWSTORMS AND BLIZZARDS: Damage to Property - ?; ALL OTHERS: Damage to Property - 5



April 1971: Kentucky — Storm Data: Page 45, Number of persons injured on April 27 at 7:20 p.m. in Muhlenberg, Butler, and Warren Counties - 1.
Storm Summary: Tornado injuries total 151.

May 1971: Minnesota — Storm Summary: Number of tornadoes should be 4.

May 1971: Nebraska — Storm Summary: Number of tornadoes should be 18.

June 1971: Minnesota — Storm Summary: Number of tornadoes should be 8.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), December

B. Temperature Departure from 30 - Year Mean (°F 1931-60), December 1971.

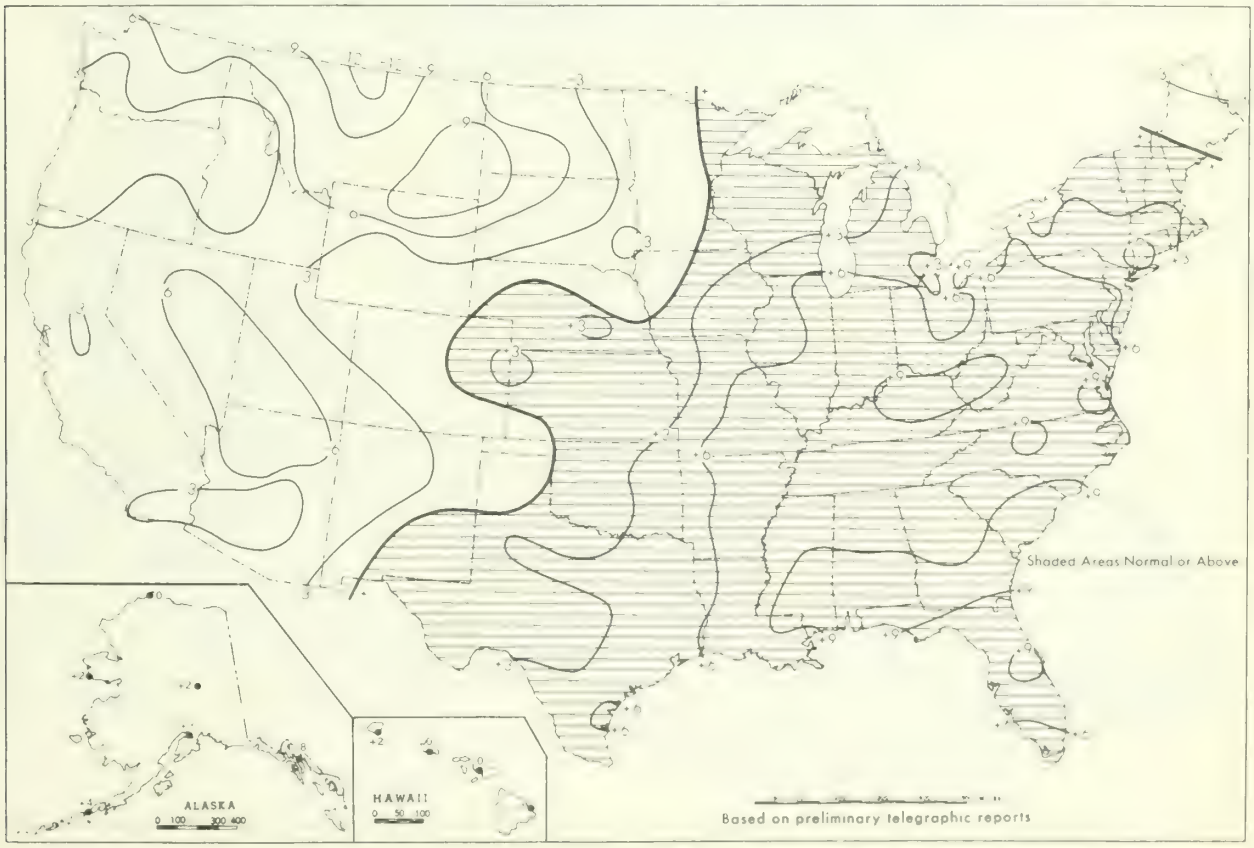


Chart II. Total Precipitation (Inches), December 1971.

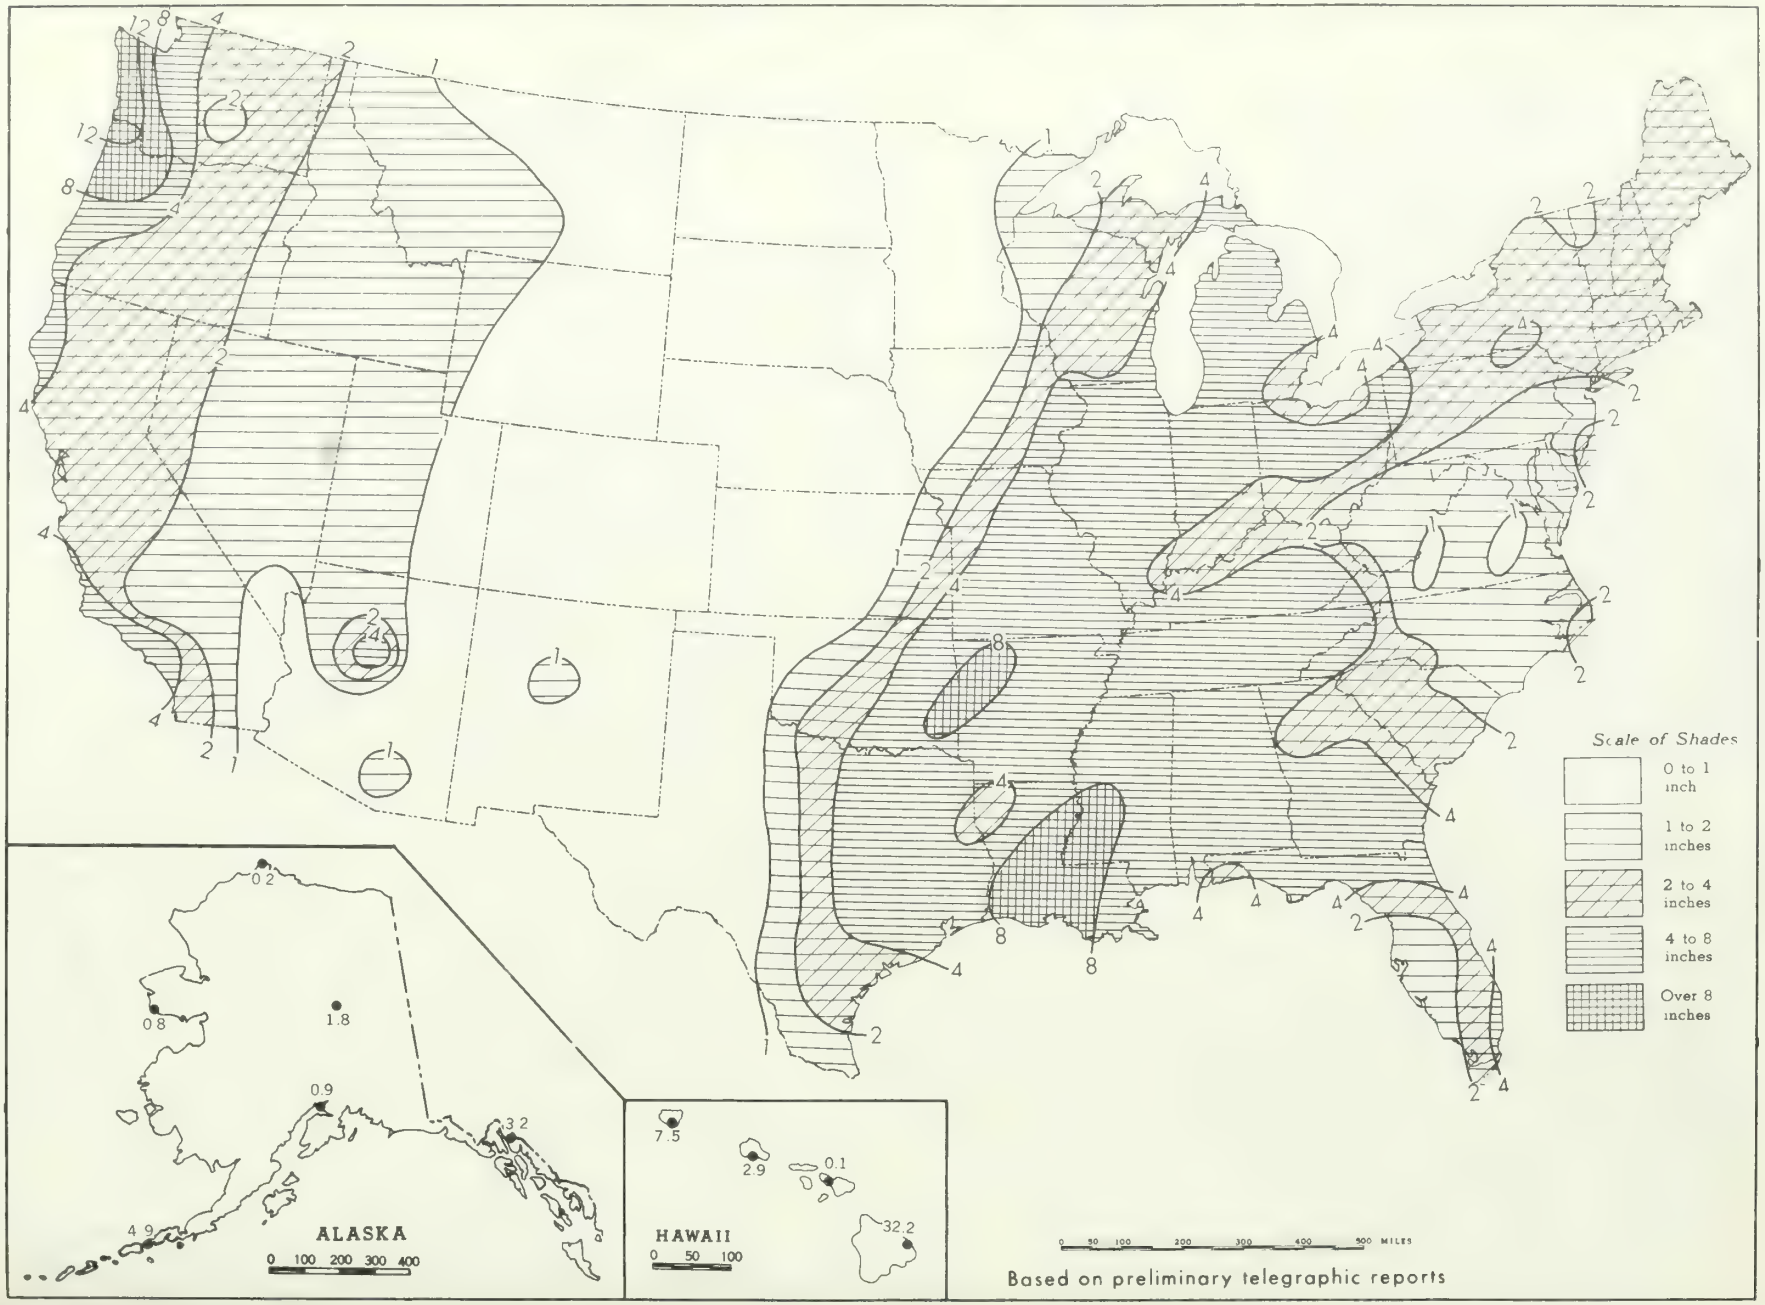

Chart III. Percentage of Normal Precipitation, December 1971.

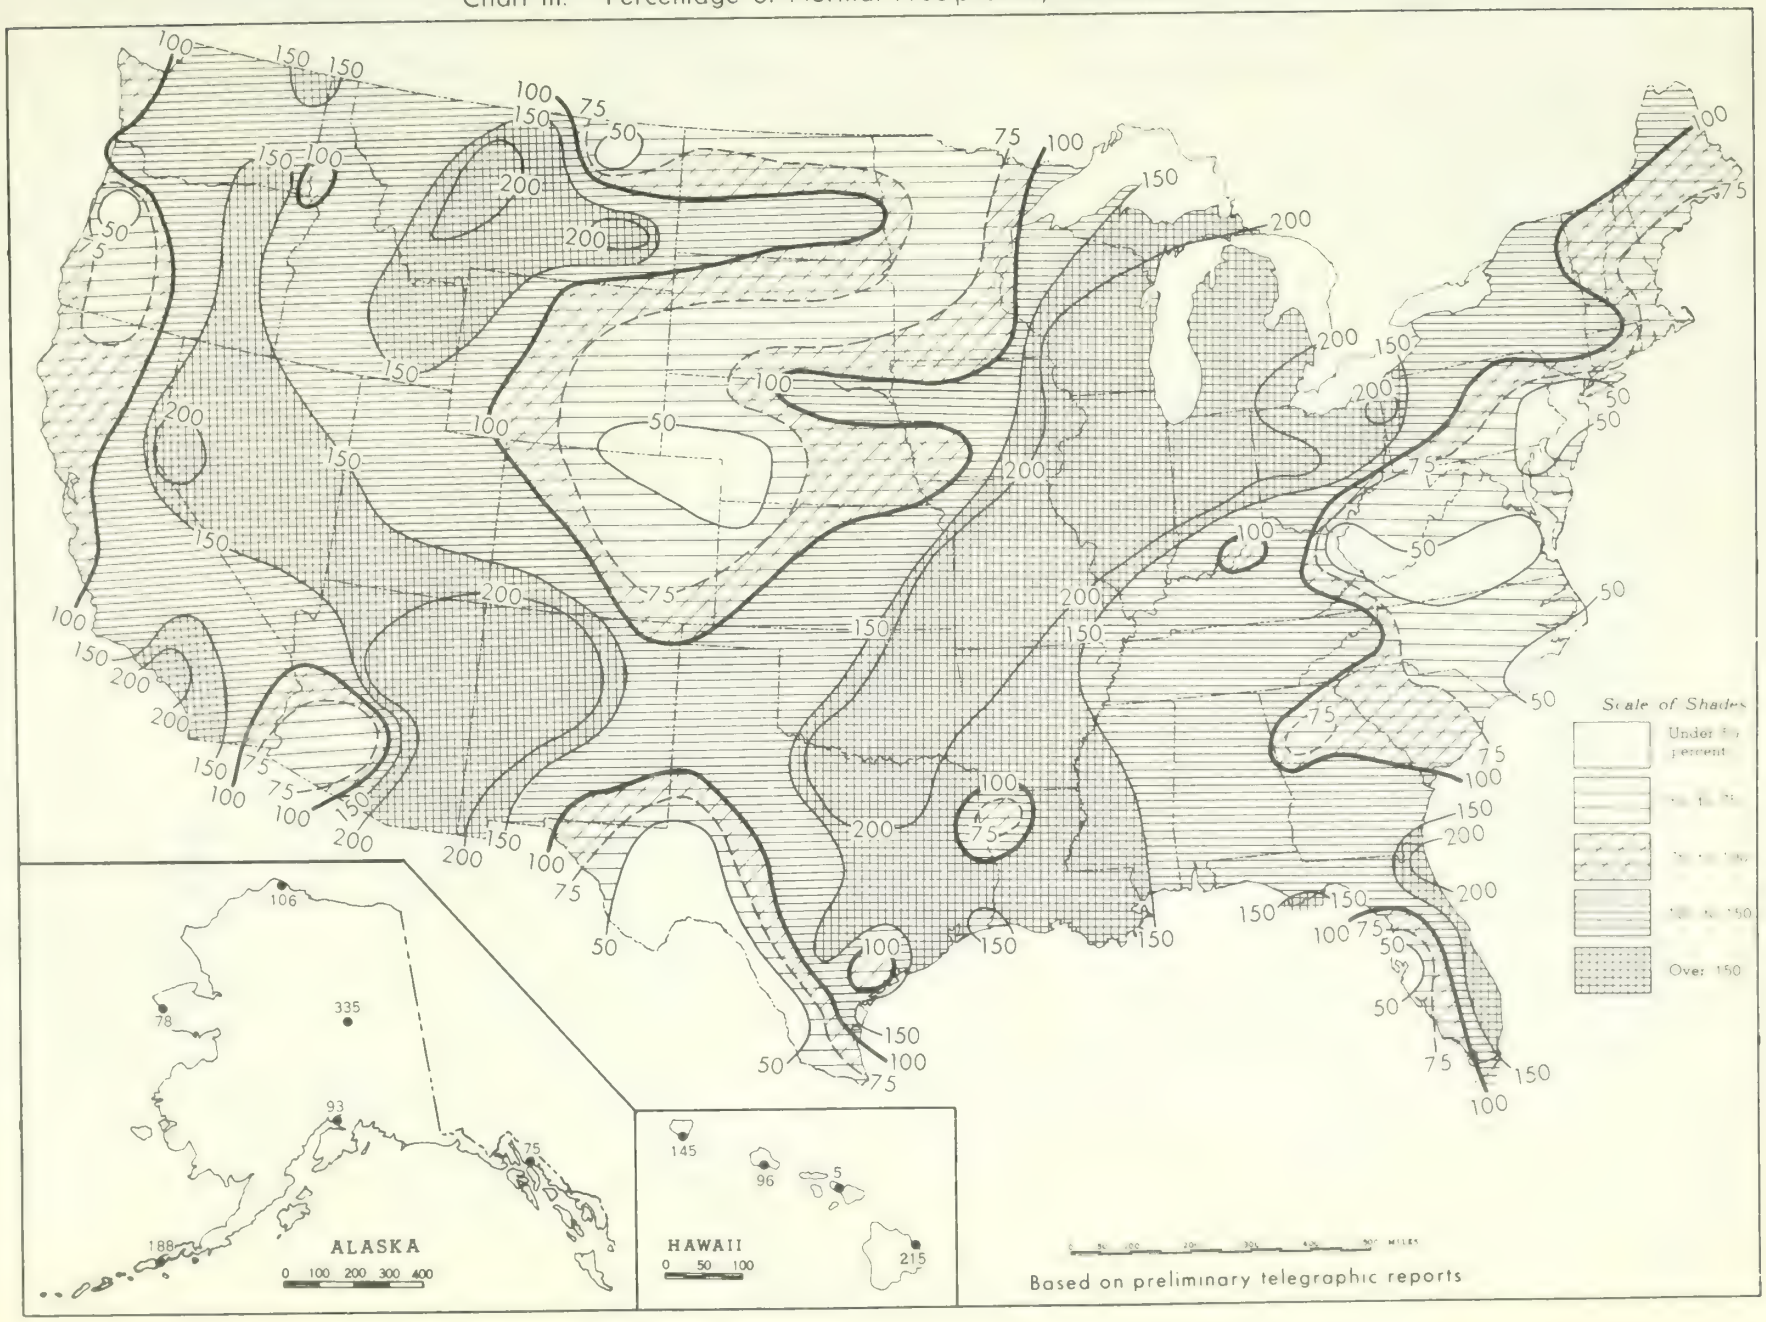

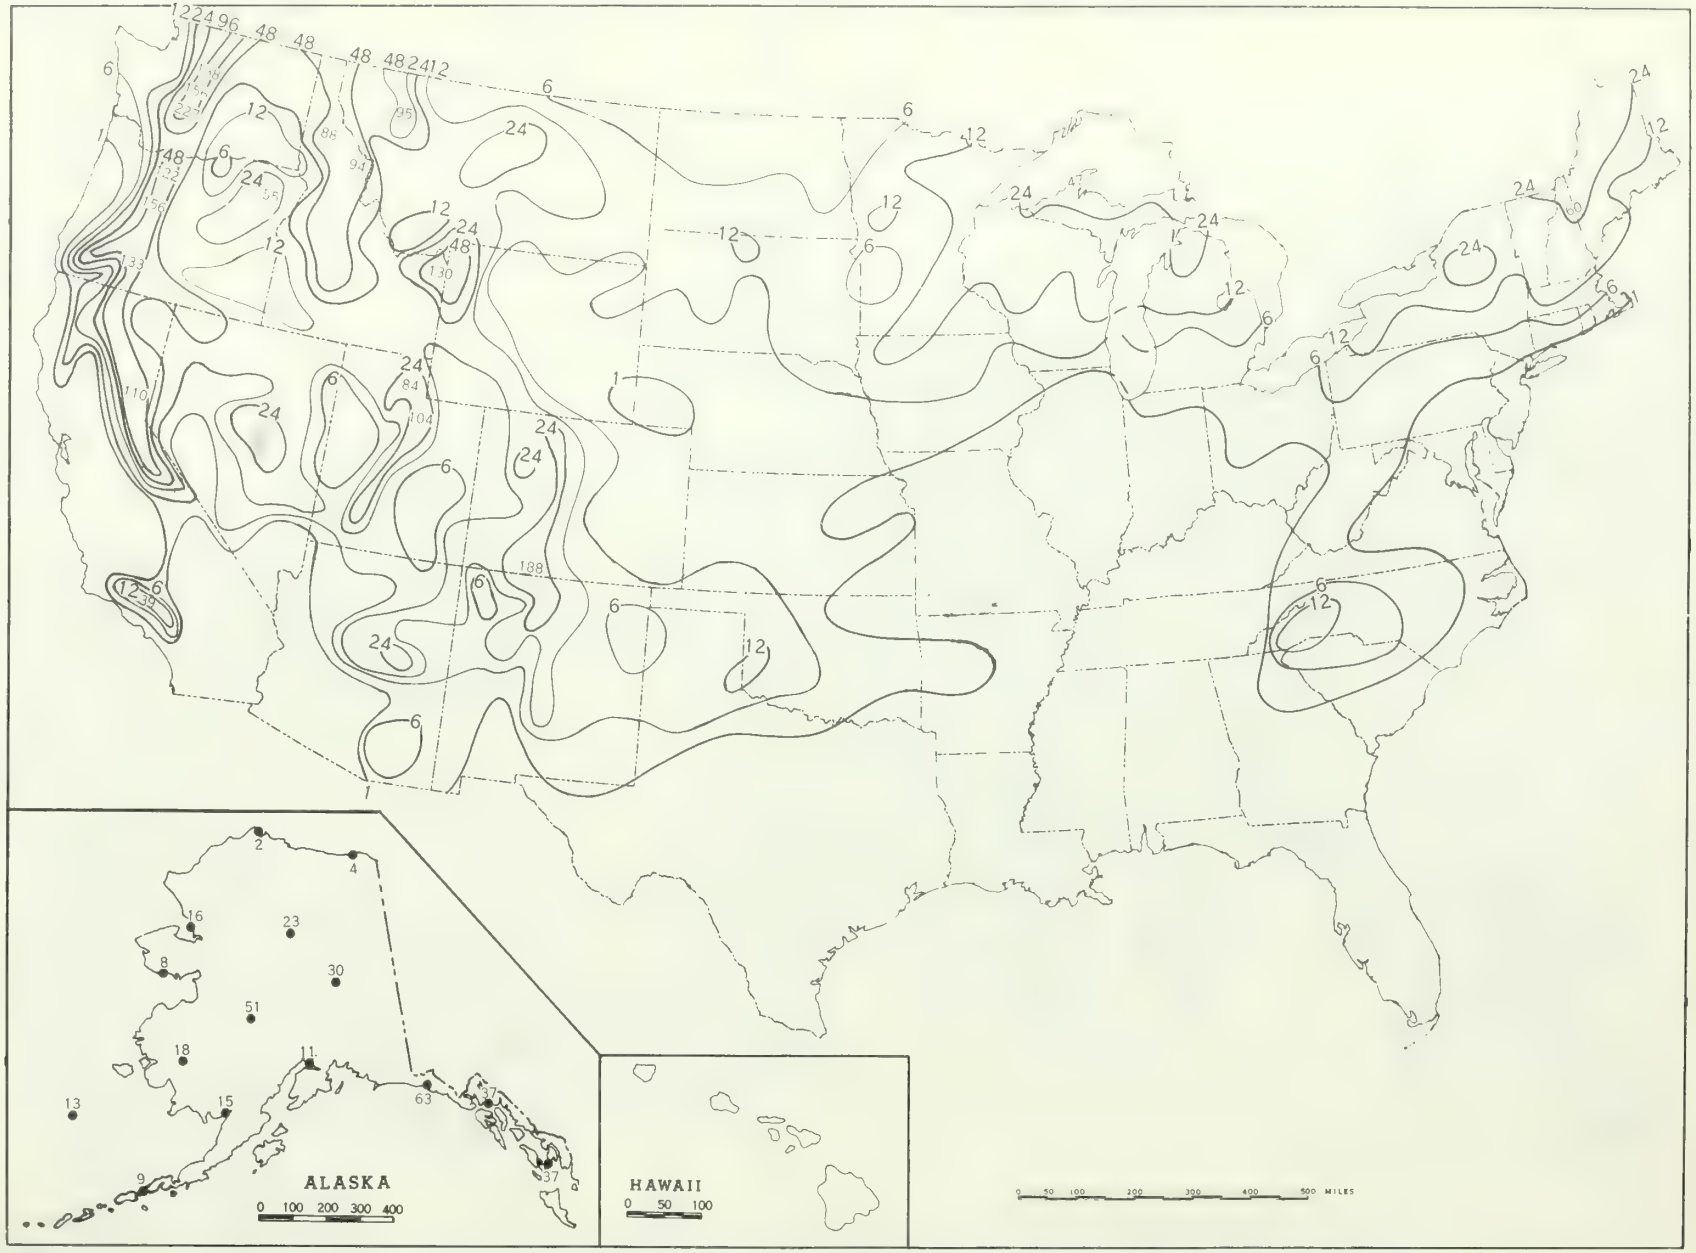

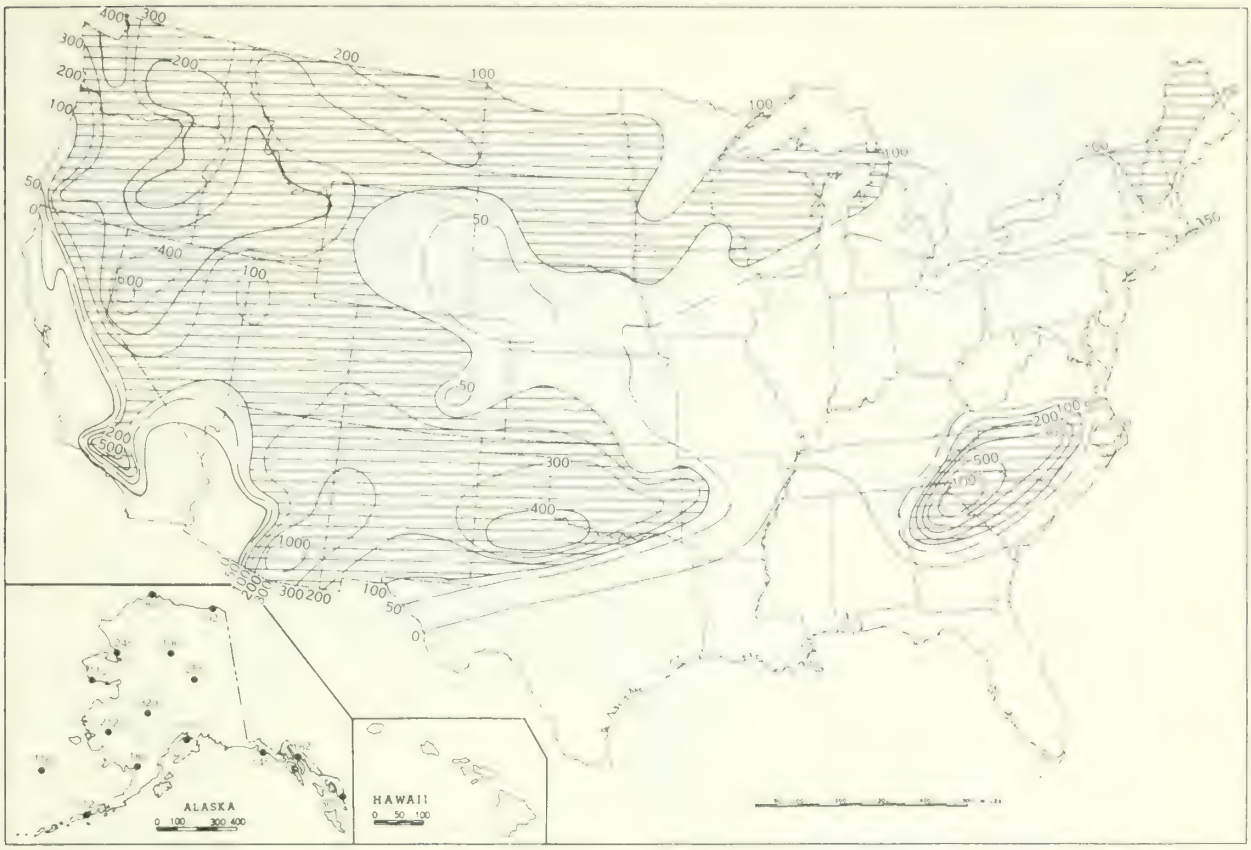

Chart IV Total Snowfall (Inches), December 1971.

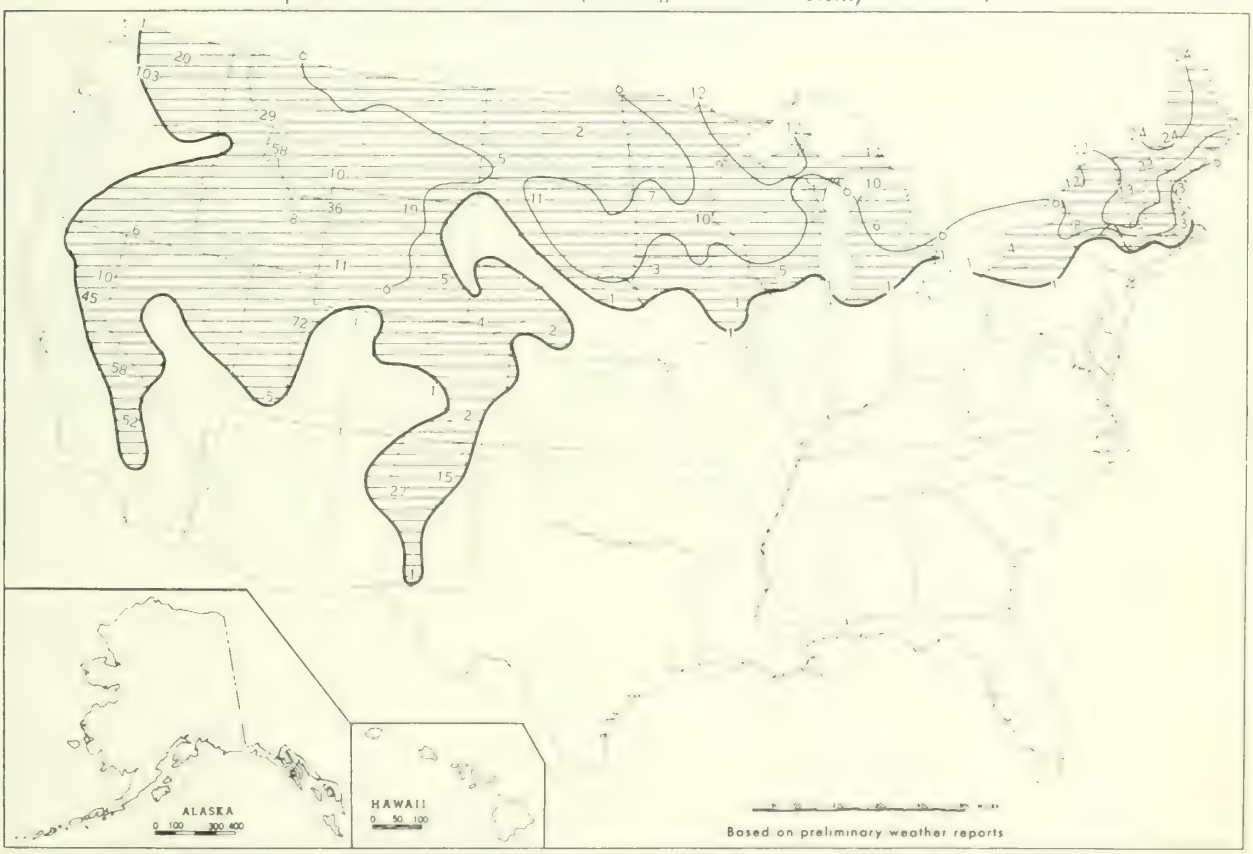
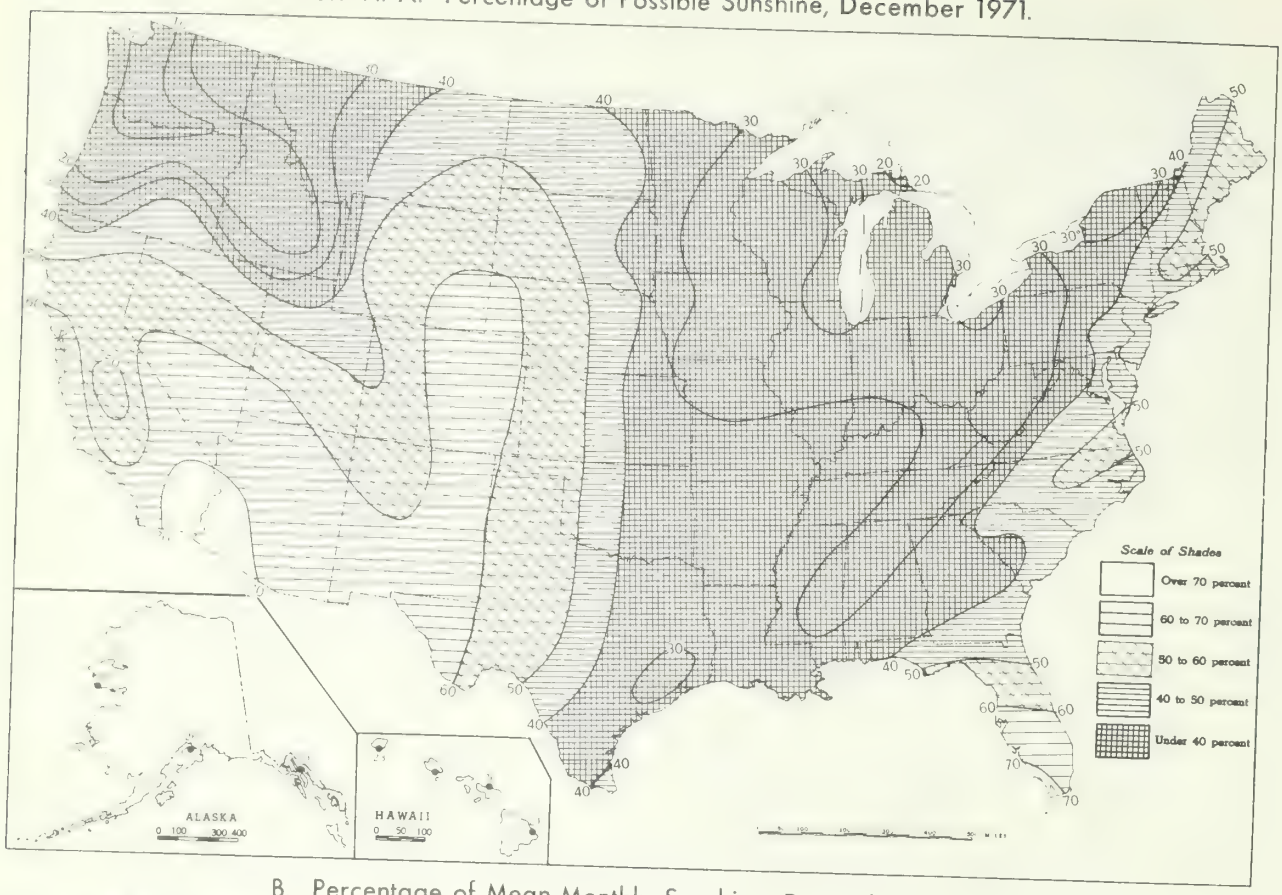
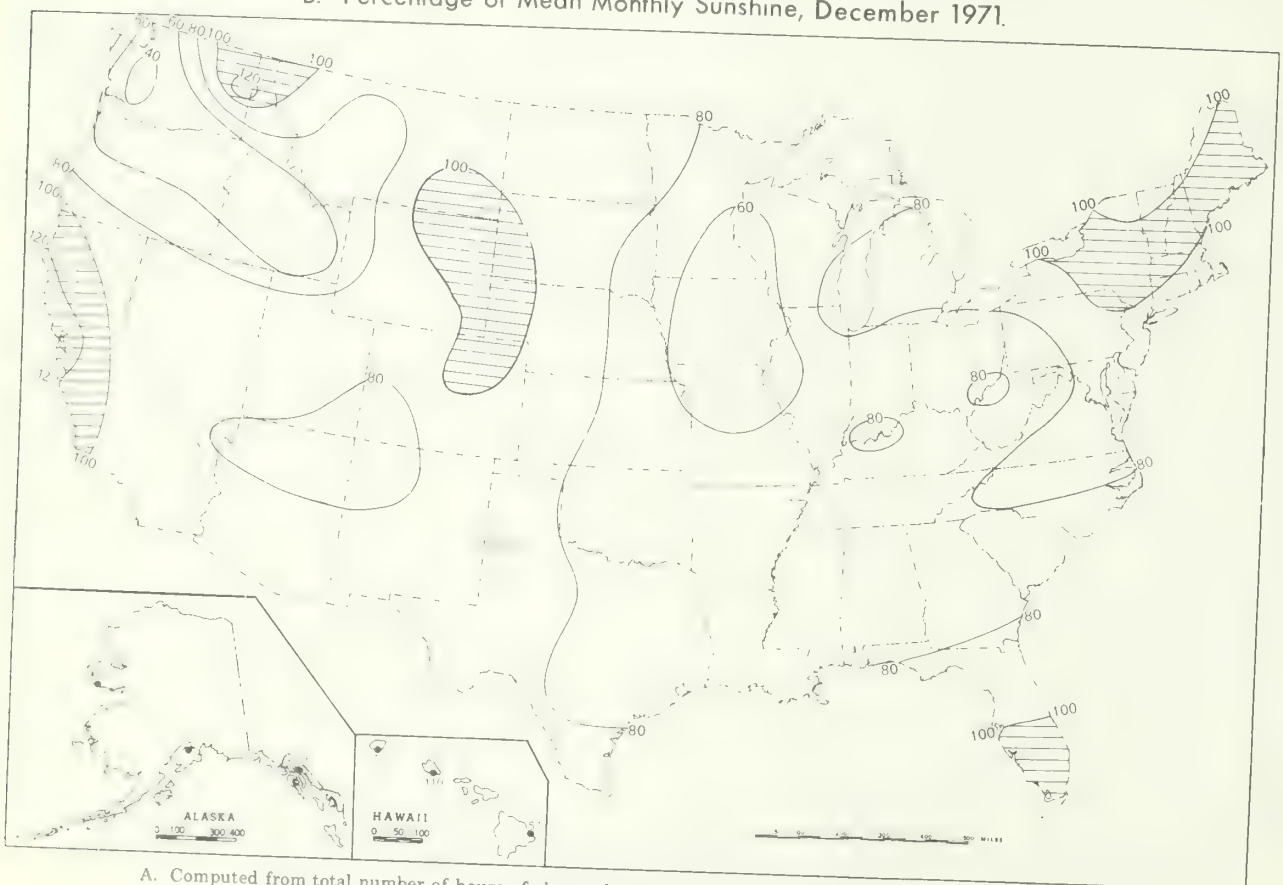


This is the total of unmelted snowfall recorded during the month at **National Weather Service** and selected cooperative stations. This Chart and Chart V are published only for the months of November through April, although of course there is some snow at higher elevations, particularly in the Far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, December 1971.

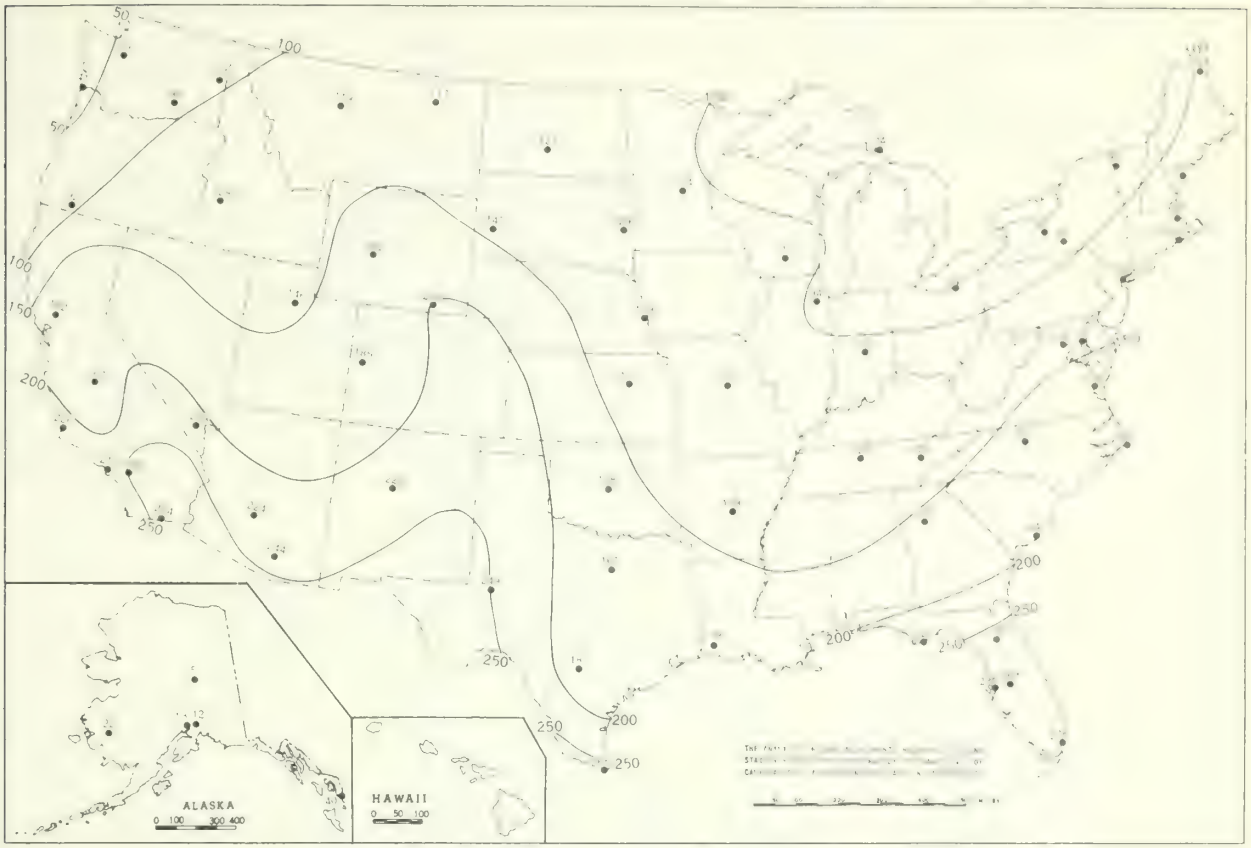


B. Depth of Snow on Ground (Inches), 7:00 a.m. e.s.t., JANUARY 3, 1972

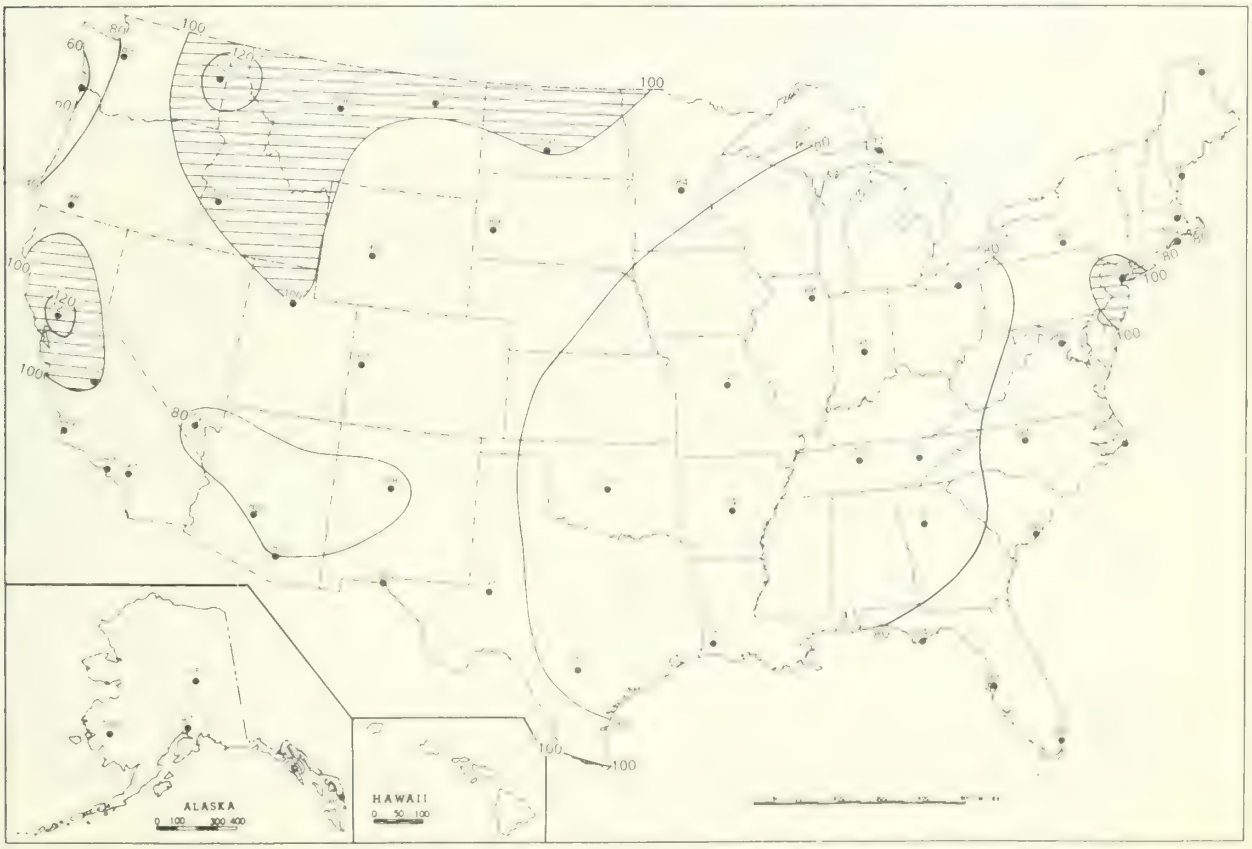


A. Amount of mean monthly snowfall is computed for **National Weather Service** stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. e.s.t., of the Monday nearest the end of the month.
It is based on reports from **National Weather Service** and selected cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, December 1971.

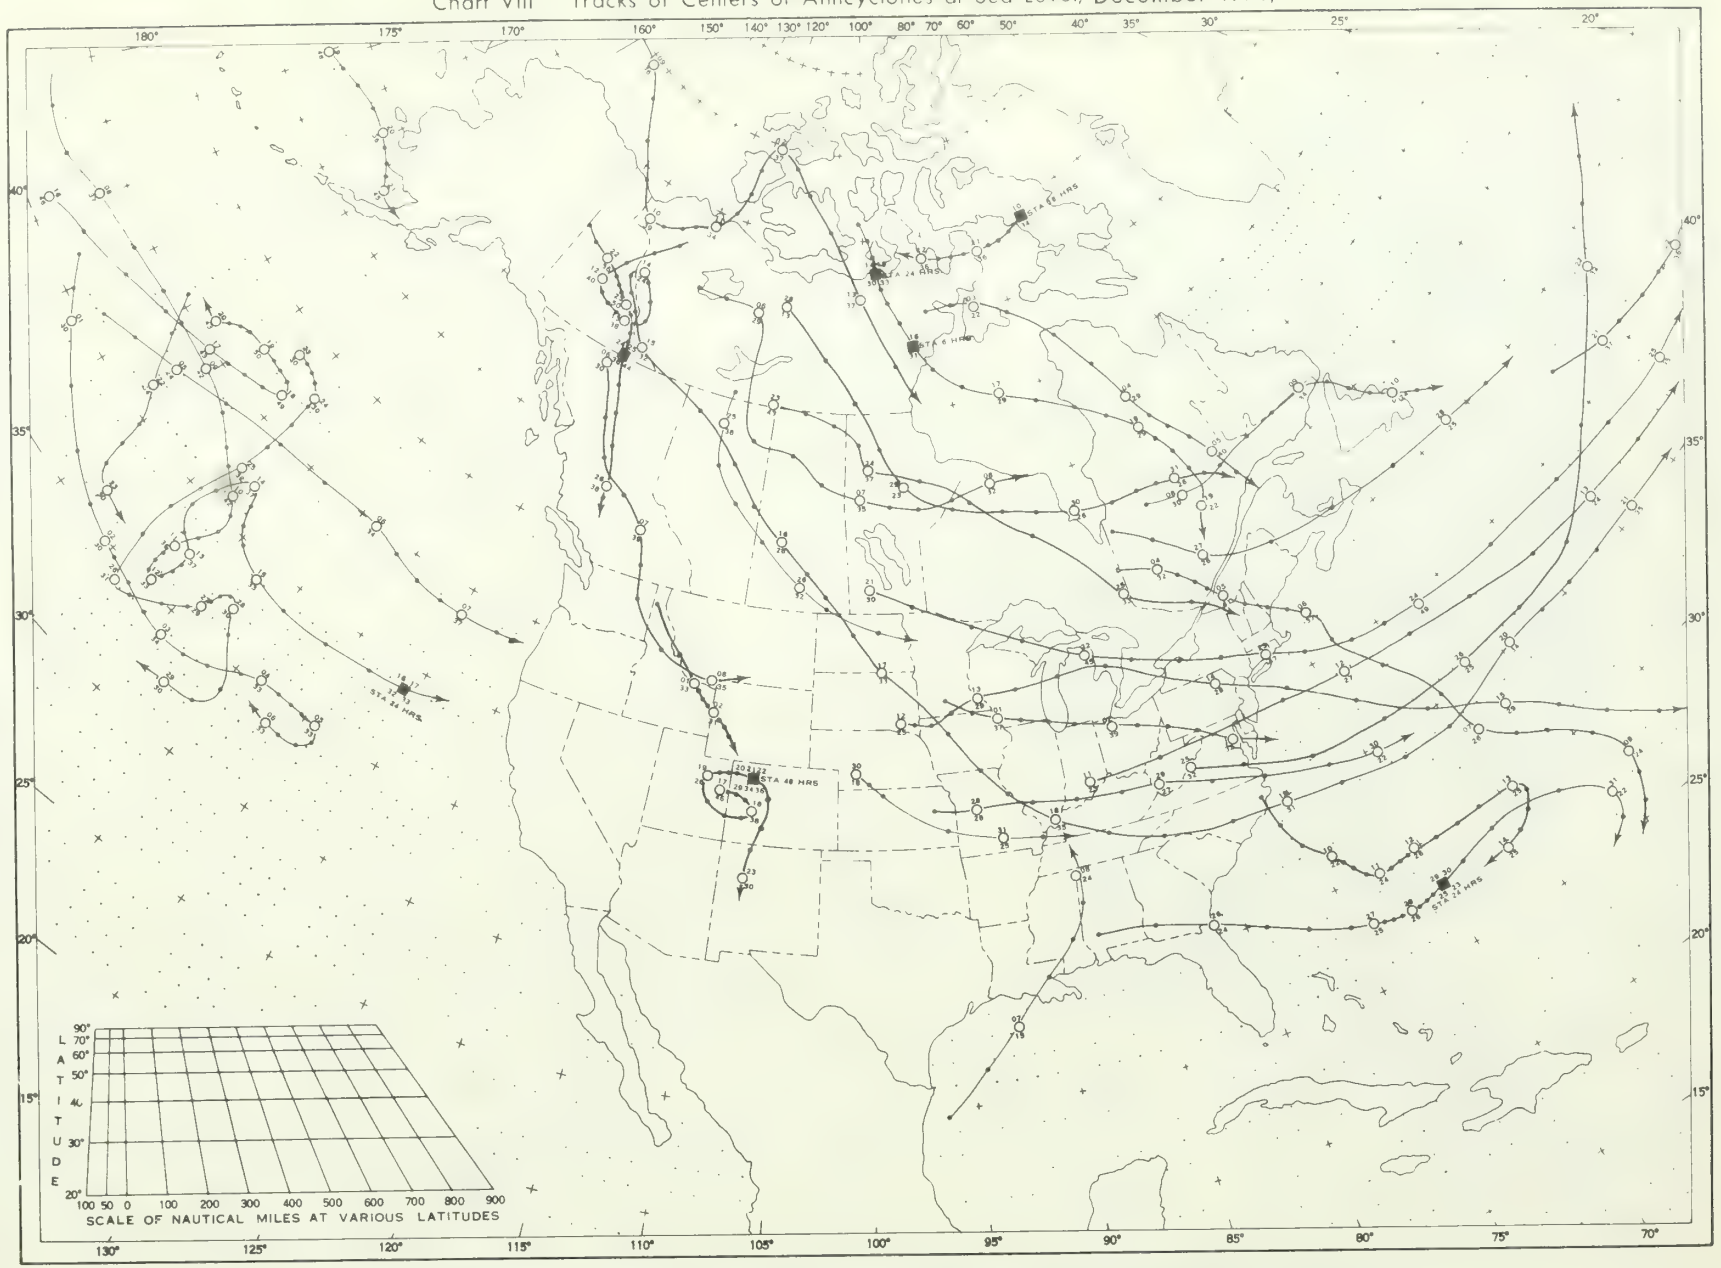


B. Percentage of Mean Monthly Sunshine, December 1971.

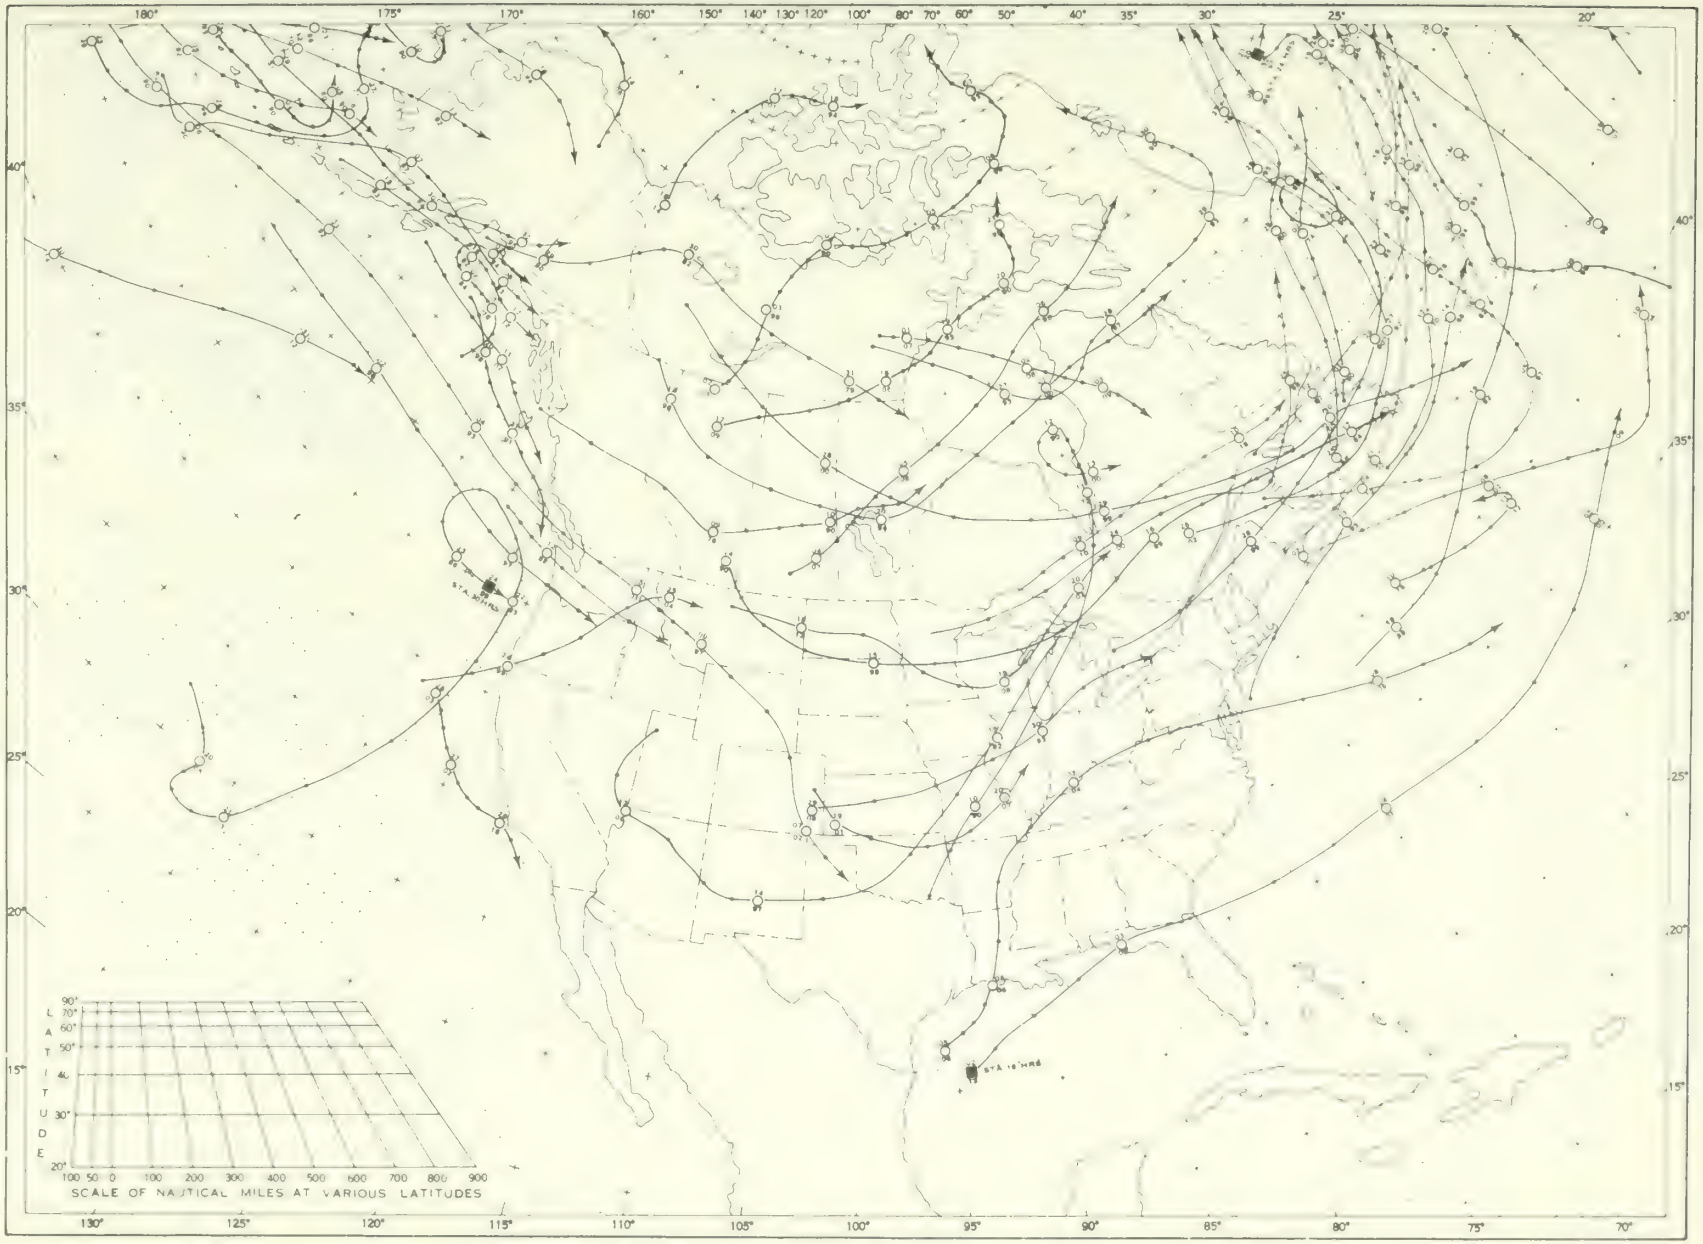


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, December 1971.

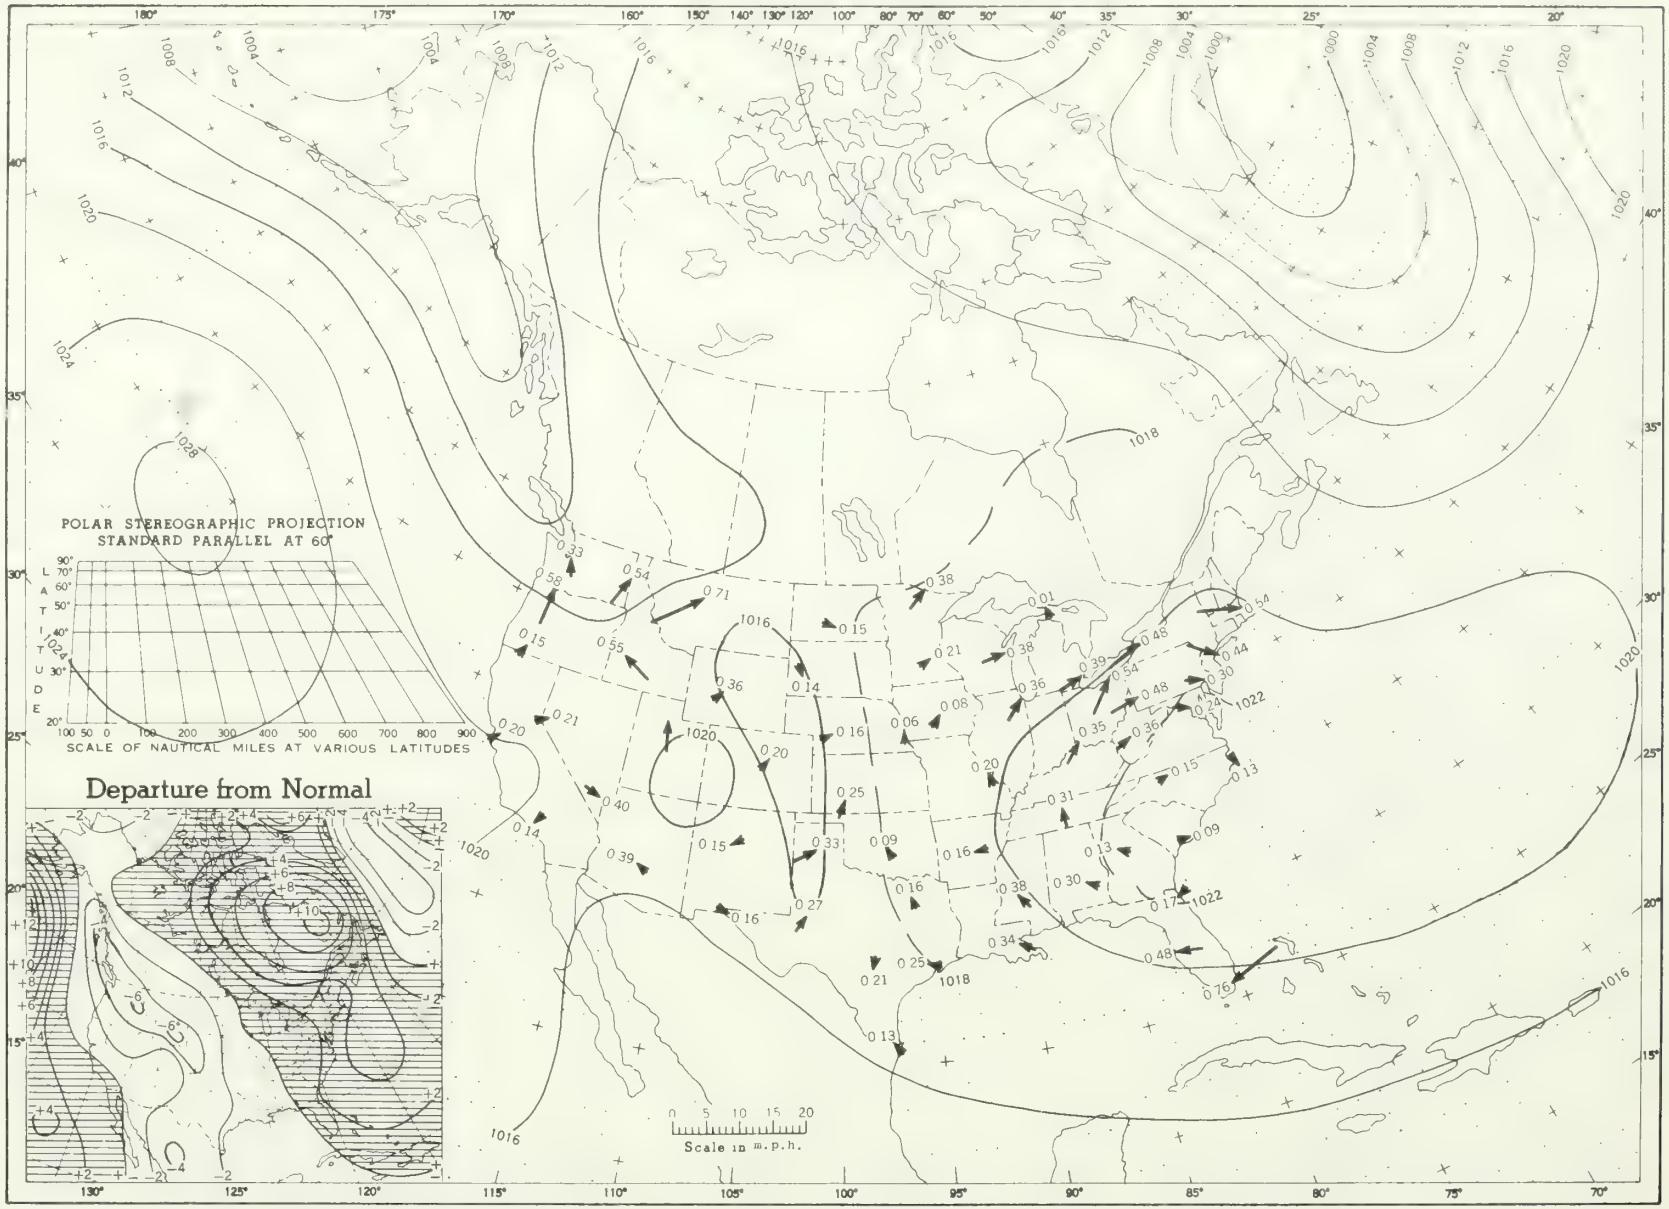


B. Percentage of Mean Daily Solar Radiation, December 1971.



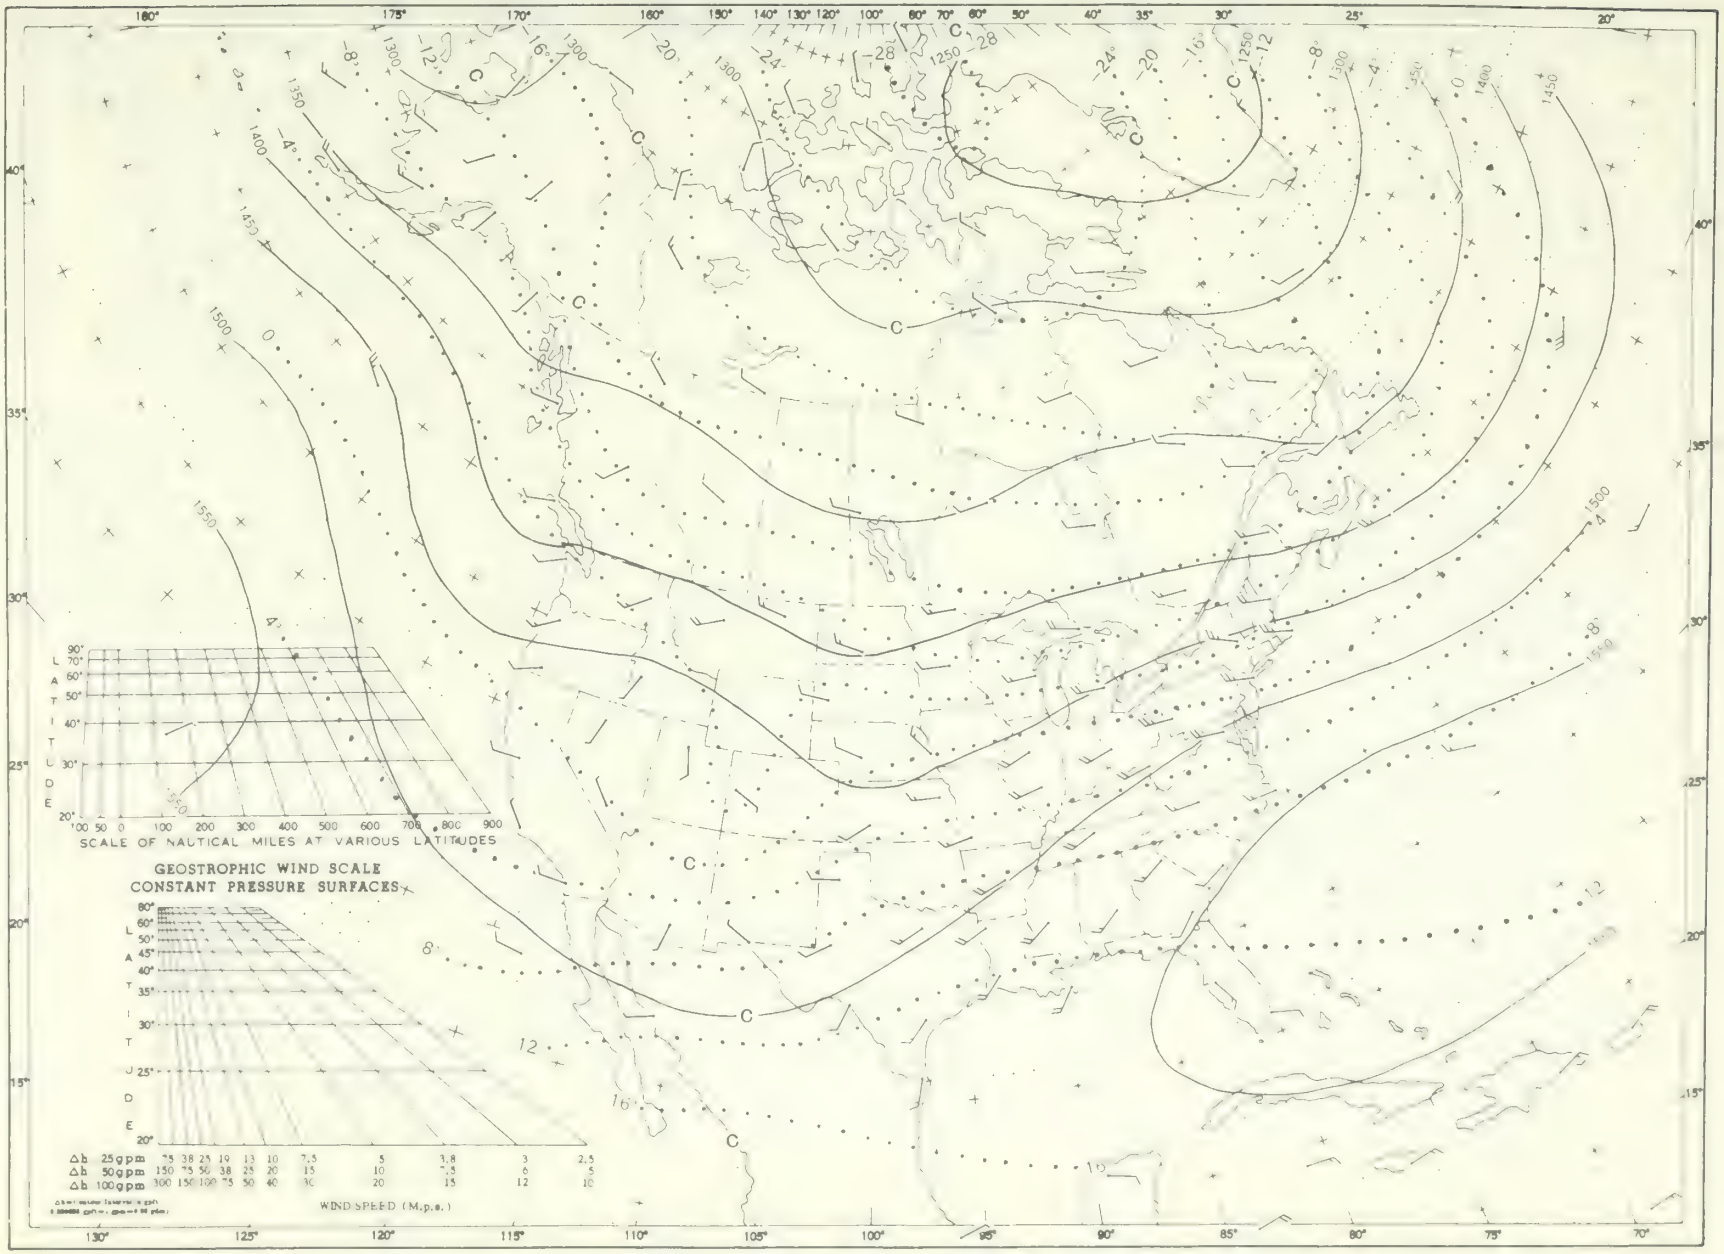
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII Tracks of Centers of Anticyclones at Sea Level, December 1971.



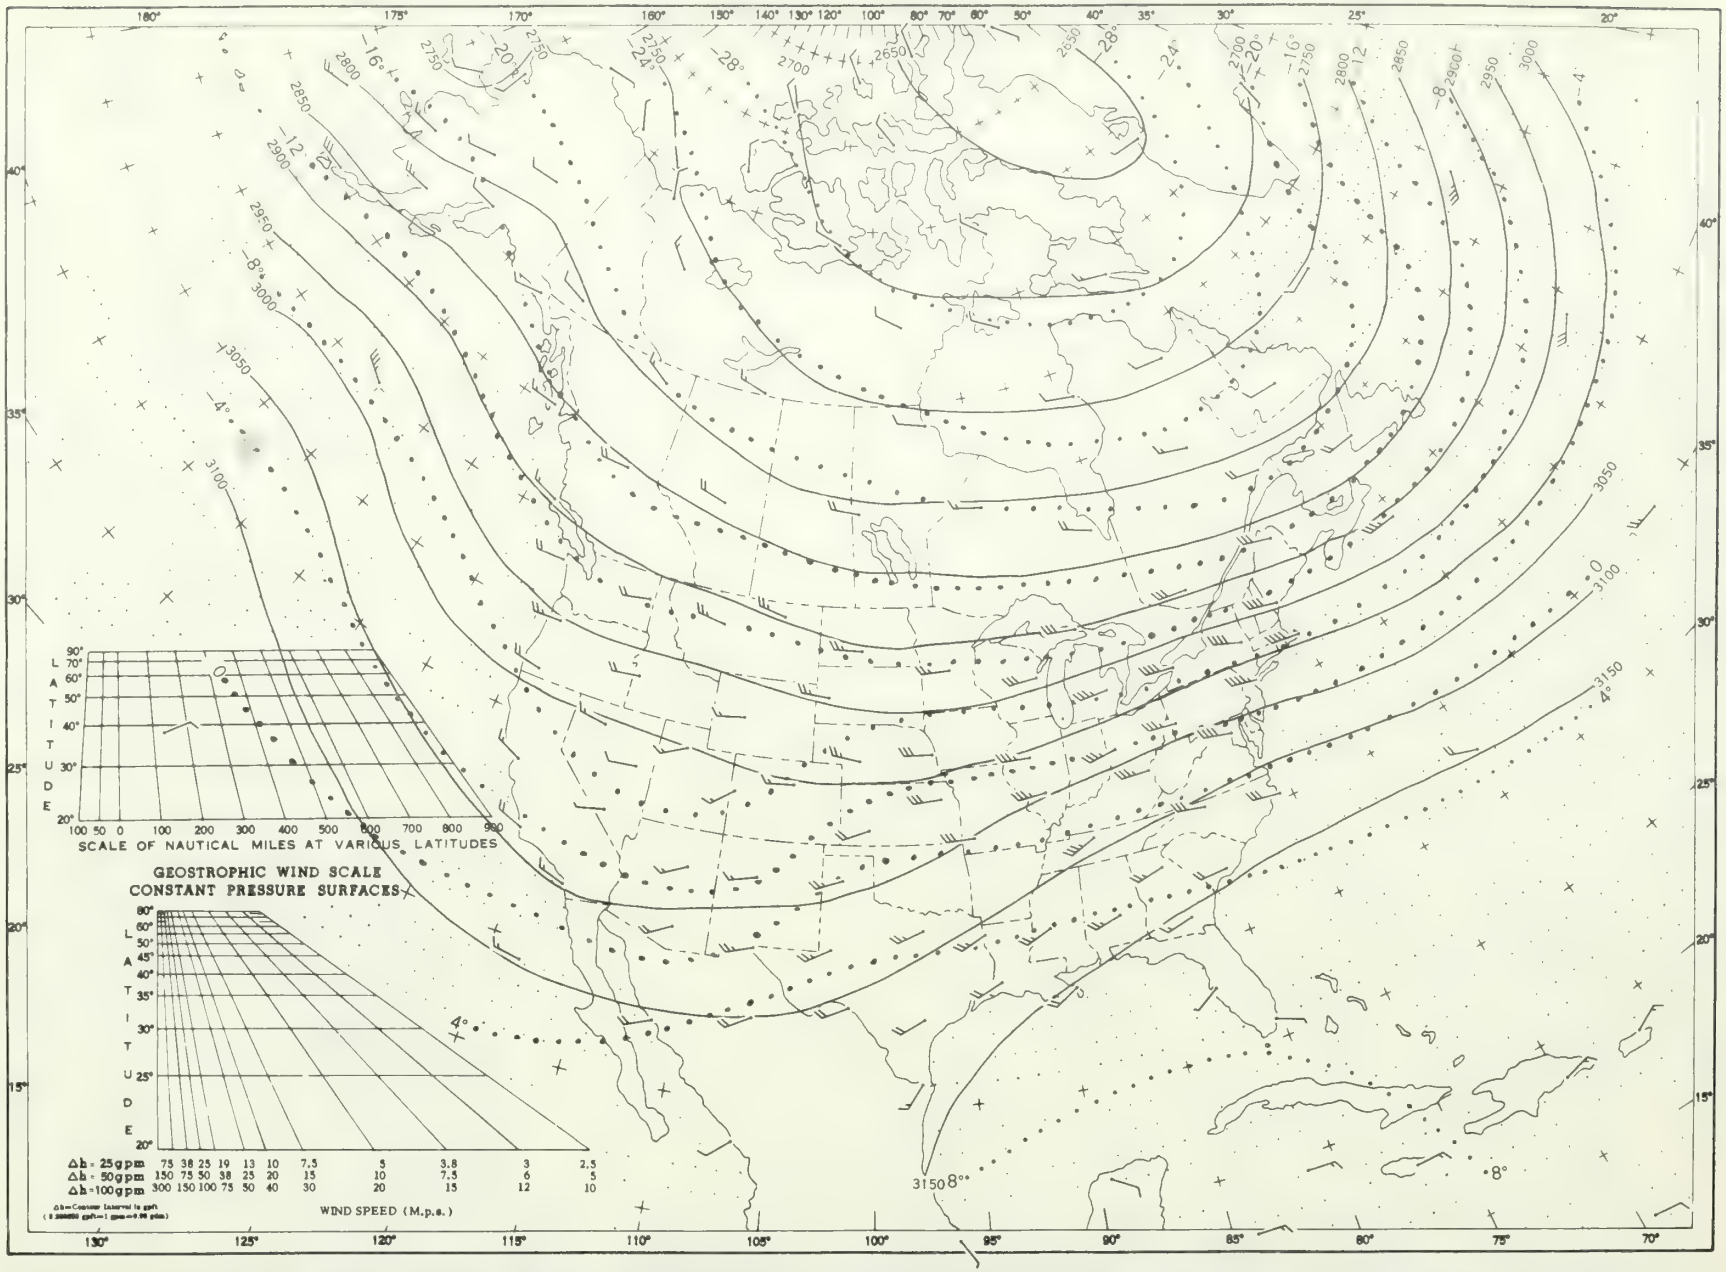
Circle indicates position of center at 7:00 a.m. E.S.T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX Tracks of Centers of Cyclones at Sea Level, December 1971



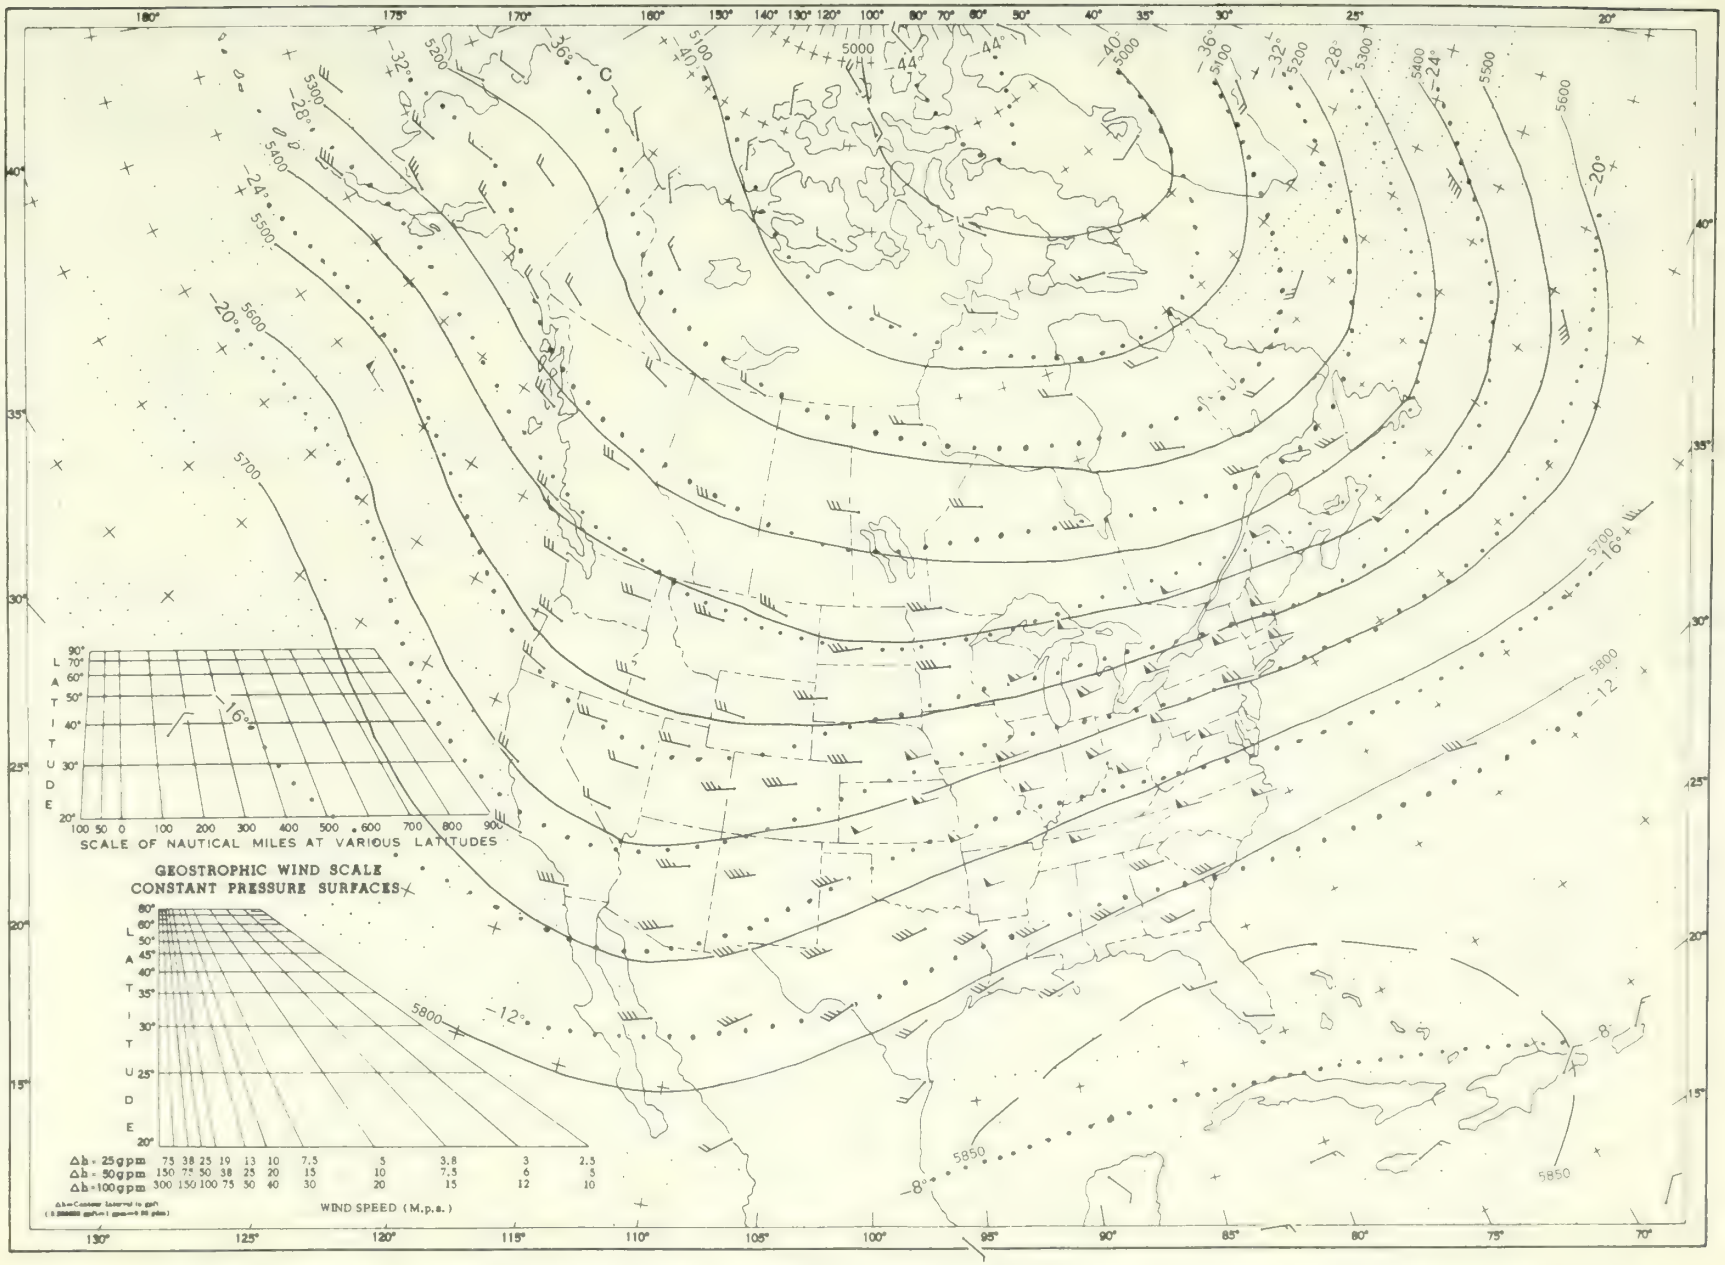
Circle indicates position of center at 7:00 a.m. E.S.T Figure above circle indicates date, figure below, pressure to nearest millibar Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart X Average Sea Level Pressure (mb) and Resultant Surface Wind, December 1971. Inset Departure of Average Pressure (mb) from Normal, December 1971.



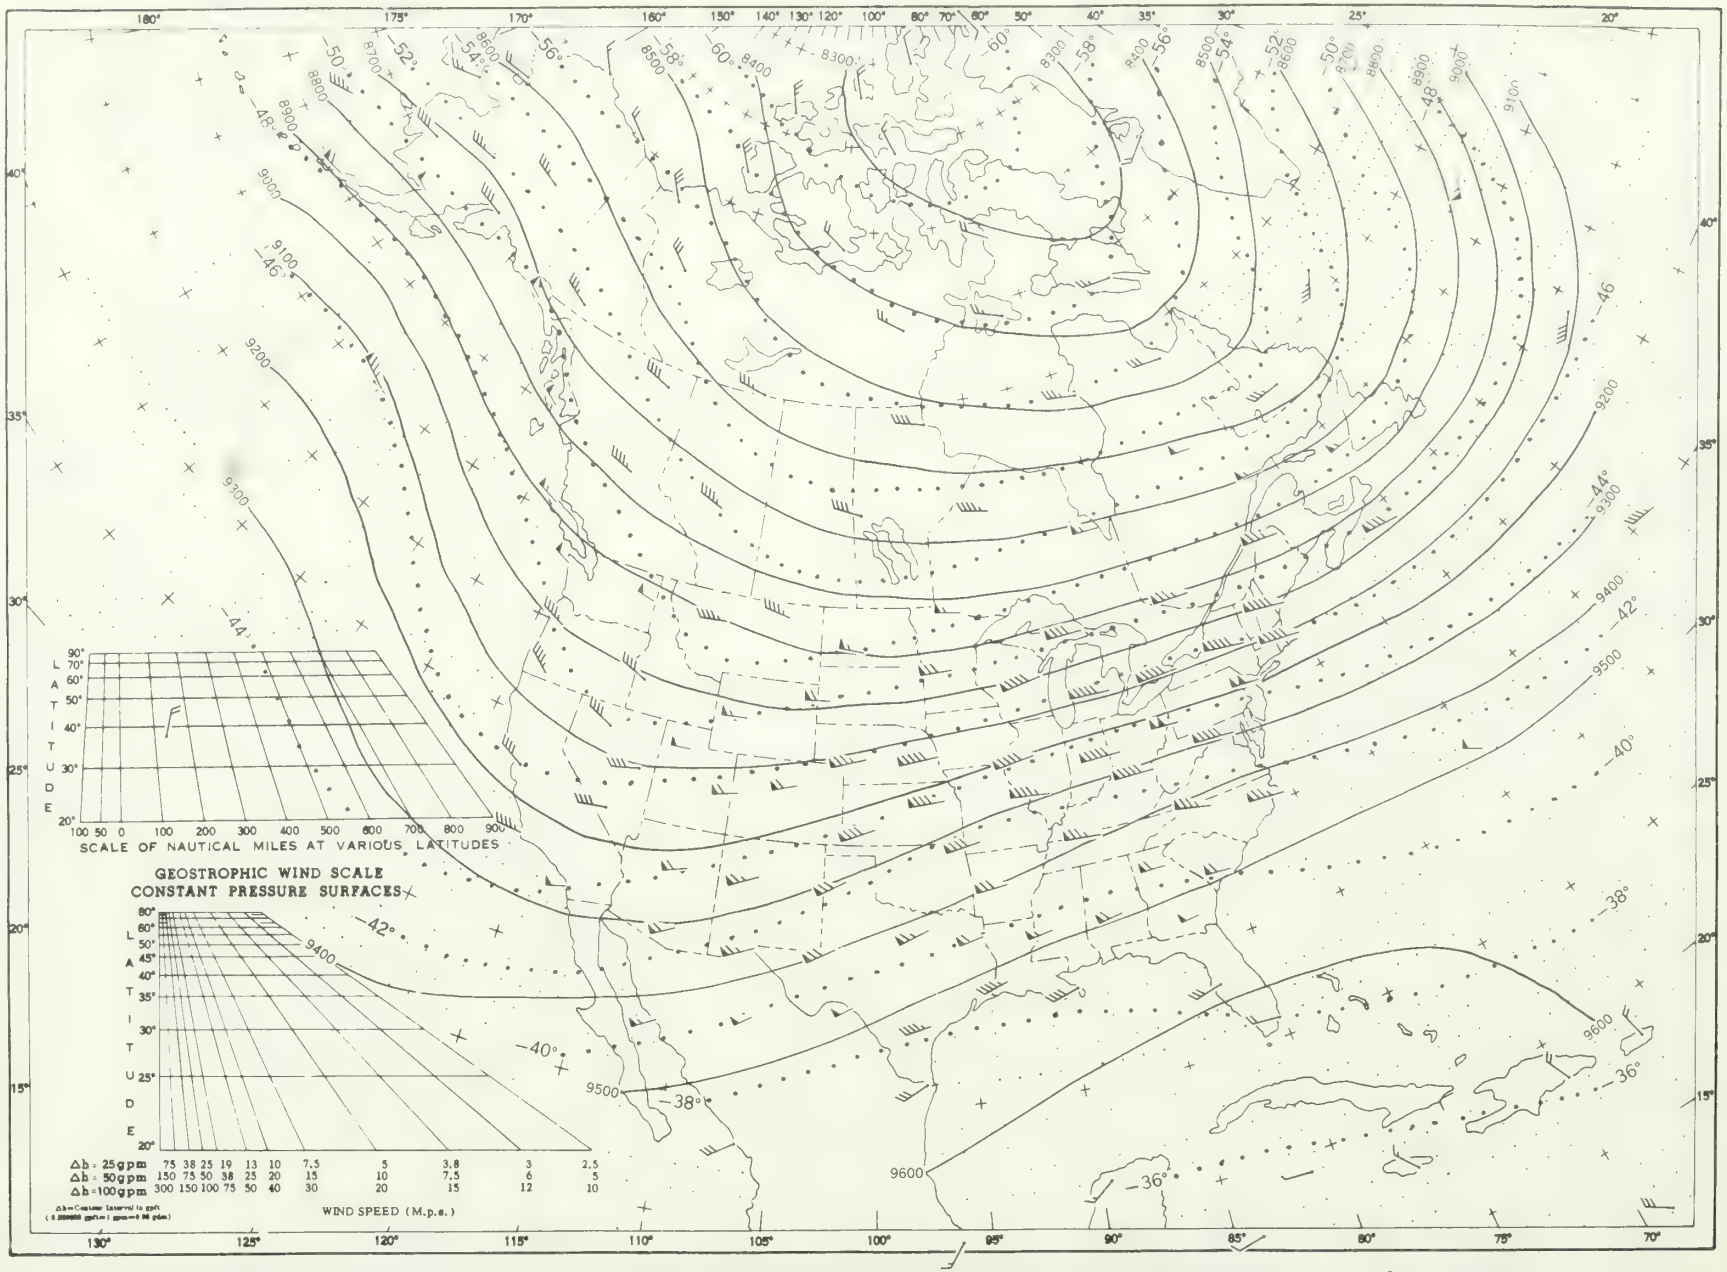
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb Surface, 1200 G.m.t., December 1971. Average Height and Temperature, and Resultant Winds



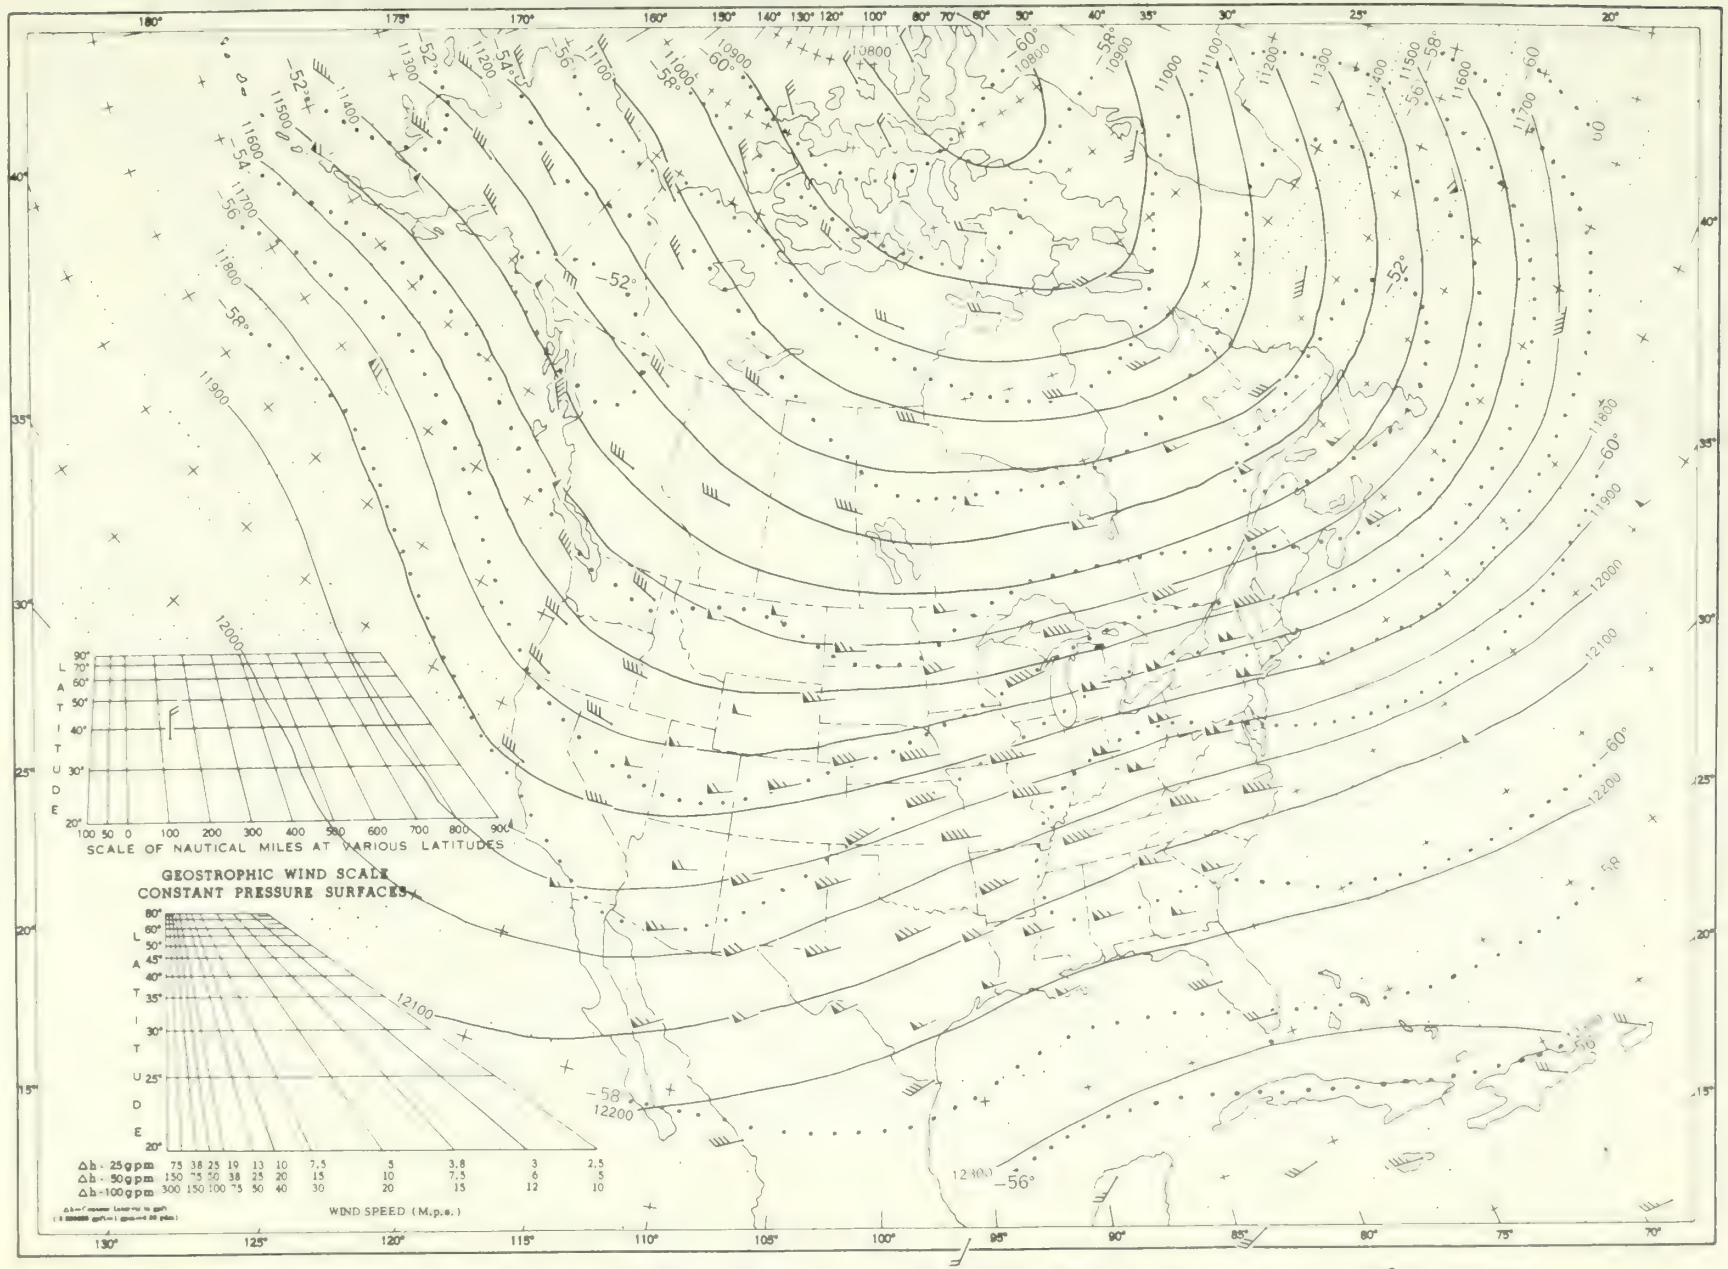
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XII. 700-mb Surface, 1200 G.m.t., December 1971. Average Height and Temperature, and Resultant Winds



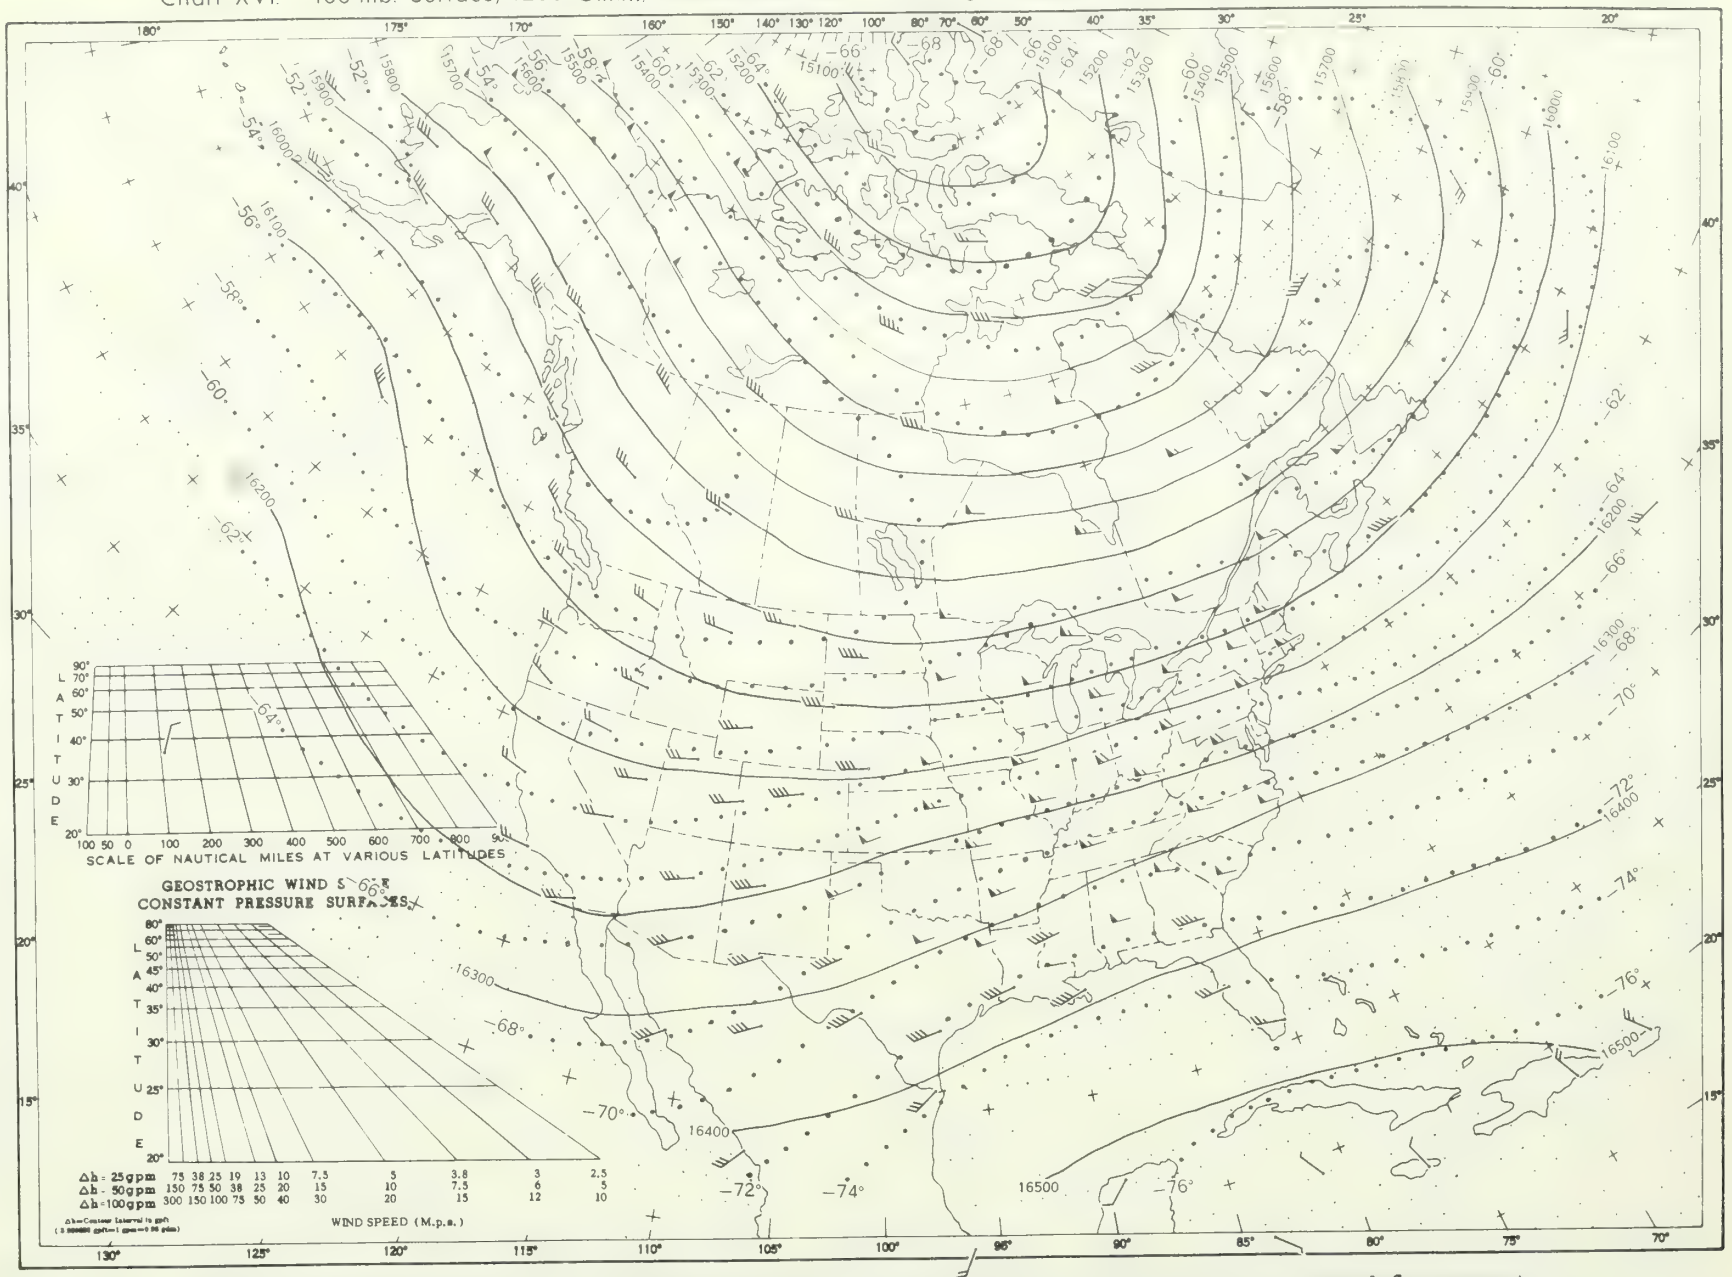
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIII. 500-mb. Surface, 1200 G.m.t., December 1971. Average Height and Temperature, and Resultant Winds.



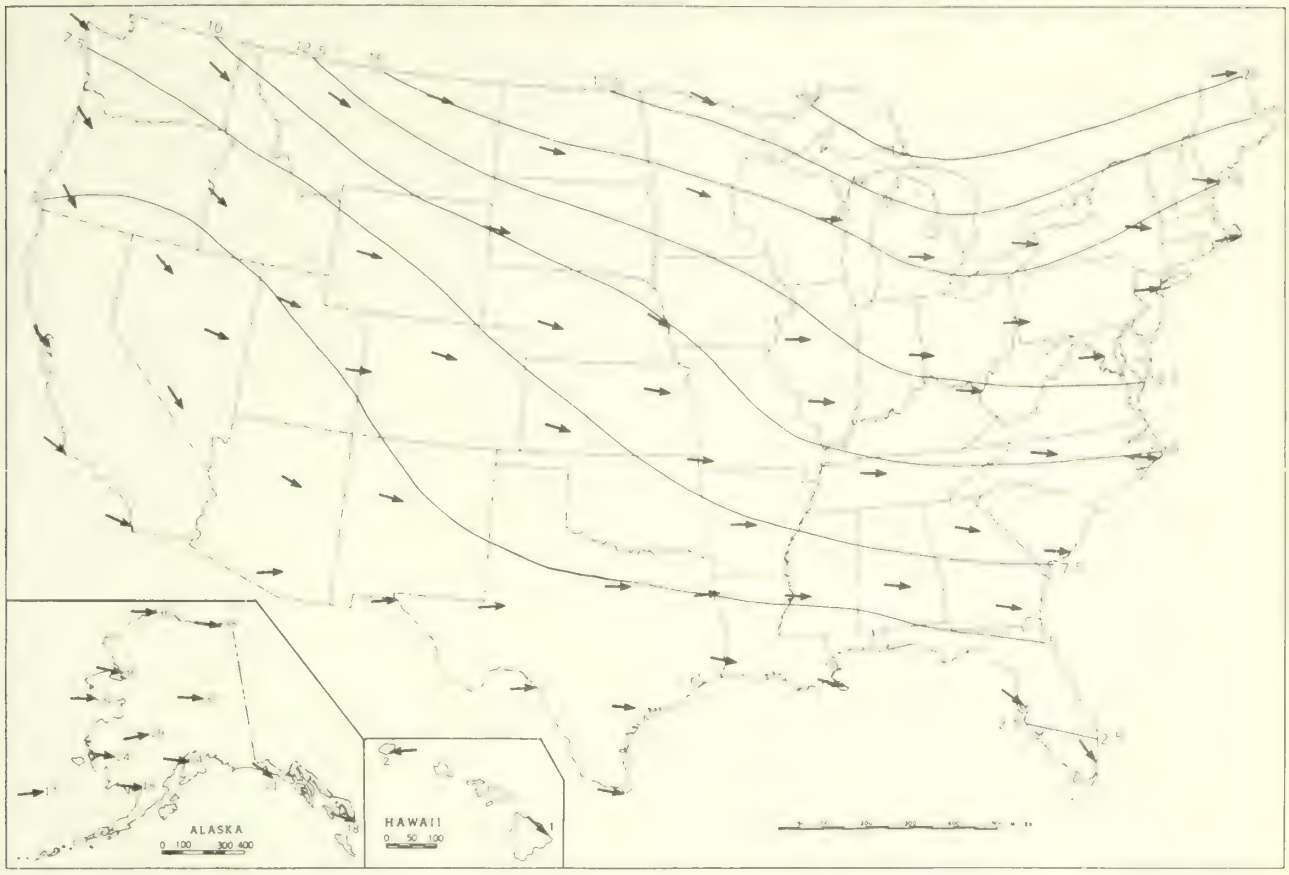
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XIV 300-mb Surface, 1200 G.m.t., December 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XV 200-mb. Surface, 1200 G.m.t., December 1971. Average Height and Temperature, and Resultant Winds



Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in meters per second; flag represents 25 mps, full feather 5 mps, and half feather 2.5 mps. All wind data are based on rawin observations.

Chart XVI. 100-mb. Surface, 1200 G.m.t., December 1971. Average Height and Temperature, and Resultant Winds

YEAR 1971

GENERAL SUMMARY OF WEATHER CONDITIONS

WEATHER HIGHLIGHTS, 1971:

1. Very favorable weather in Corn Belt
2. A year with few major floods
3. Heavy March snowfall in Northeast
4. Cool July central and eastern areas
5. Drought in Texas and southern Florida
6. Precipitation adequate most of West.

WINTER--Temperatures for the winter of 1970-71 averaged below normal from the central and upper Great Plains to the Atlantic coast and in portions of the eastern Gulf States, but were above normal elsewhere. From the northern Great Plains to New England both December and January were abnormally cold. Precipitation was near to above normal in most northern and eastern areas, but well below from Arkansas and Louisiana through the southern two-thirds of California. In much of Texas, New Mexico, Arizona, and southern California less than half the usual amounts were recorded.

The January temperature anomaly pattern was about the same as that for the winter in the contiguous 48 States--cold in the northeastern half where a flow of cold northern air persisted most of the month, and warm in the southwestern half as a result of frequent inflows of mild Pacific air. Even though temperatures in the West averaged well above normal for the month, the first decade was extremely cold with subzero minima extending deep into Arizona and New Mexico. A new alltime record low of -40° for Arizona was recorded at Hawley Lake on the 7th and the lowest temperature ever recorded in New Mexico during January, -47°, was reported by Eagle Nest on the 6th. This freeze caused some damage to citrus and vegetables in the Southwest.

The rest of January was unusually mild in the West, with temperatures rising to record high levels for the month at many stations. These included Los Angeles, 95° on the 18th; Phoenix, Ariz., 88° on the 19th; Albuquerque, N. Mex., 69° on the 31st; and San Antonio, Tex., 89° on the 30th.

January was extremely cold in New England. Portland, Maine, had its coldest month on record and recorded its lowest temperature for January, -26° on the 19th. Albany, N. Y., recorded its lowest temperature for any month, -28°, on the 18th. Below-freezing temperatures dipped down into the Florida Peninsula on the 20th and 21st and damaged citrus, truck, and other crops as the low temperatures were comparable to those of some other historic freezes.

This January was among the coldest on record in Alaska. Fairbanks observed its coldest month ever with an average temperature of -31.7°, a high for the month of 27° and a low of -60°. On the 25th the highest temperature was -54°, and after the 12th the highest was only -19°. A temperature of -79.8° was recorded at Prospect Creek Camp on the 23d, the lowest ever for Alaska and the United States.

Temperatures for February were quite changeable and averaged within 3° of normal. Most of the western Great Basin, New England, and the Middle Atlantic States were warmer than normal and most of the southeastern quarter of the contiguous 48 States were abnormally cold. The first week, relative to normal, was very cold east of the Rockies and warm in the West, while the reverse was true the second week. The third week was mild from coast to coast, and the last week was mild in the East and cold in the West. Temperatures in the contiguous 48 States ranged from -46° at Van Norman, Mont., on the 7th to 97° at McCook and Mission, Tex., on the 1st.

Precipitation was abnormally heavy during January in the eastern portions of Georgia and the Carolinas, west of the Great Lakes, and in the Central Great Plains. Elsewhere, January totals were below normal, less than half normal from Arkansas and Louisiana westward. February was a stormy month east of the Rockies, with above normal precipitation that was unusually heavy from the Central Great Plains to the Great Lakes, in the lower Ohio Valley, and Middle Atlantic States. Many stations reported near record amounts, and local flooding occurred in a number of areas. In most of Texas and west of the Great Plains, February precipitation was well below normal.

Winter snowfall in the West was above average in many northern areas, decreasing to much below in Arizona, New Mexico, and adjacent areas of adjoining states. Snowfall was unusually heavy in northern areas during December and generally above average during January. Nearly all areas had below average amounts in February. On March 1 the western water supply outlook was good to excellent except poor in New Mexico, Arizona, and southern Colorado.

SPRING--The spring season was mostly dry and cool. Only Maine, the upper Great Plains, central and southern Texas, and the lower east coast of Florida were warmer than normal. Both March and April were abnormally cool in the Pacific Northwest, and all three spring months were cool east of the Mississippi. Precipitation was above normal in Washington, Oregon, Nevada, Wyoming, a small portion of the central Great Plains, and an area including Virginia, the Carolinas and central portions of Georgia, Alabama, and Mississippi. The season was unusually dry in Florida, Oklahoma, Texas, New Mexico, and Arizona. Snowfall was above average in many northern areas and some sections of the Southeast. Drought became severe in Florida, parts of Texas, Oklahoma, Arizona, and New Mexico. Severe local storms took the usual toll of life and property. Damage resulting from spring floods and freezes was mostly limited to local areas and was less than usual. March temperatures averaged below normal in the Pacific Northwest and east of the Mississippi, and above, elsewhere. Monthly averages set no new records, but a number of stations reported new record highs and lows for the month. The first week was very cold. Boise, Idaho, recorded 6° on the 1st, the lowest there for March in 65 years, and 23° on the 5th tied the record March low at Tallahassee, Fla. New record March highs occurred in the Southwest during the closing days of the month, with record March highs of 100° for Waco and San Antonio, Tex., on the 28th. On the 29th 95° equaled the record March high for Phoenix, Ariz. Alaska was unusually cold with many new March lows including -19° for St.

Paul on the 2d, -42° for King Salmon on the 13th (lowest for any month), and -46° for Nome on the 11th.

March precipitation was deficient in most areas and less than half normal in the Southwest, southern Florida, the Ohio Valley, and much of the midcontinent area. In the lower Great Plains and Southwest more than 300 stations reported no precipitation at all. With less than 30 percent of normal precipitation, this was one of the driest Marches in Texas and the fifth consecutive dry month. In southern Florida where Key West recorded only a trace for the third time during any month in the last 100 years, March continued the dry regime of the past several months. Above-normal precipitation was limited mainly to the Pacific Northwest, northern New England, parts of the Great Lakes region, and an area in the Southeast that extended from Mississippi to the Carolinas.

In Washington, Oregon, and much of the northeastern quarter of the Nation, a considerable portion of the monthly precipitation fell in the form of snow. Much above average totals set new March totals, at many stations, including Elkins, W. Va., 33.0 inches; Yakima, Wash., 10.8 inches; Binghamton, N. Y., 33.5 inches; and Alpena, Mich., 35.8 inches, most of it falling during storms on March 6-7 and 18-19.

In addition, March snowfall boosted seasonal totals to new records at a number of stations among which were Portland, Maine, 132.3 inches; Erie, Pa., 117.0 inches. A general snow cover of 40 to 60 inches in Vermont, following a heavy snowstorm on the 7th and 8th, ranged up to 116 inches at Mt. Mansfield, a new State record. After another storm on the 11th and 12th, Guilford and Springfield, Maine, each reported a depth of 76 inches, a new record for that State.

Snowfall in the Southeast during a storm on the 25th and 26th was unusually heavy for so late in the season. In several counties of northwestern South Carolina falls ranged from 7 to 11 inches. Columbia, S. C., measured a record late-season fall of 1.7 inches, and Greensboro, N. C., one of 3.3 inches.

In the West, mountain snowfall was above average in the Cascades and parts of the central Rockies. April was relatively dry, cool, and sunny in most areas. Average monthly temperatures, ranging within 3° of normal, were above normal only in the upper Great Plains, central Texas, and along the lower east coast of Florida. New temperature records were few and scattered and only for a particular day or for so early or late in the season. Considerable fruit was damaged in western Colorado on the 1st when Grand Junction recorded 16°.

Precipitation during April was below normal except above in parts of the West and a few small scattered areas in the East. The wettest area, relative to normal, was centered in Wyoming where monthly totals exceeding 4 inches ranged up to more than 200 percent of normal. In contrast, less than half the normal precipitation fell in a large area extending from the central Great Plains to the central Appalachians, an area in which several stations with records dating back 90 to more than 100 years reported the driest April on record. Other areas with less than half normal included northeast Oregon, southern California and western Arizona, most of Louisiana, parts of Oklahoma, east Texas, and southern Florida. The dry weather permitted rapid progress of agricultural activities which were about 2 weeks ahead of normal in much of the Corn Belt. But the dry weather also created a high fire hazard in the Ohio Valley and intensified the droughts in southern Florida and parts of Texas. Extreme drought developed in central Texas, and even though 1- to 3-inch rains fell about the 15th to 17th benefits were only temporary. By the end of April southern Florida was in the grip of one of its worst droughts. Fires spread over 250,000 acres of the Everglades, Lake Okeechobee fell to near a record low level, and with a below-sea-level water table in the Miami area salt water threatened the city's water supply.

April snowfall was unusually heavy in northern New York, New England, New Jersey, the lower Appalachians, portions of Michigan and the central and upper Mississippi Valley, Wyoming, and Nevada. In Wyoming 45.2 inches at Lander and 24.2 inches at Casper were record amounts for April in 26 and 31 years, respectively. Cairo, Ill., recorded 1.0 inch on the 5th, the most snow there for April in 61 years; and Birmingham, Ala., a trace on the 7th, the first April snowfall in 61 years. At Burlington, Vt., 7.3 inches on the 10th was a record amount for so late in the season. Heavy snows in the Cascades and in the mountains of Wyoming produced one of the heaviest snowpacks on record for those areas. Heavy snowfall in Alaska also left an unusually heavy snowcover.

The May weather regime was persistently cool and wet. Drought conditions were eased in Florida, in parts of Texas, and in southwest Oklahoma. Few major storm systems developed, but many tornadoes and other severe local storms occurred in the unstable air that covered areas east of the Rockies at intervals throughout the month.

Temperatures averaged below normal except slightly above in a few small scattered areas. Relative to normal, the Southeast and southwestern desert were the coolest areas. Nashville, Tenn., had its coolest May in 47 years and its third coolest in 100 years; Montgomery, Ala., had its second coolest in 98 years and a record low of 40° for the month on the 4th. Tallahassee, Fla., had its coolest May and a new May low of 34° on the 4th.

In Arizona, Yuma had its coolest May in 38 years, and Winslow a late-season low of 27° on the 19th. Even San Francisco, Calif., where temperature departures from normal are usually small, this was the coolest May in 40 years. Farther north in the Medford, Oregon, area, frost damaged gardens and unheated orchards on the 17th. On the 13th, during advection of cold air across the Great Lakes region, Detroit, Mich., recorded a late-season low of 30°. One of the few record highs was an early-season high of 92° at Syracuse, N. Y., on the 19th during a day of sunny skies and a southerly flow of warm air in advance of a low pressure system.

Precipitation for May was near normal in most areas. Wettest areas relative to normal, were Virginia and southern portions of Nevada and California where monthly totals ranged up to more than twice the usual amounts. Driest areas of less than half normal included most of Texas, New Mexico, Arizona, and Snake River Valley of southern Idaho, and small areas around Lake Michigan.

Precipitation was well distributed throughout the month. During the first decade 1- to 2-inch rains which fell in central and east Texas were beneficial but much more was needed to completely relieve the drought. During the last week beneficial rains fell in southern Texas but the drought there was still rated severe to extreme at the end of the month. The drought in southern Florida was relieved by 2- to 4-inch rains during the week ending the 16th. Moisture conditions were generally good in central and northern areas of the Nation at the end of May.

Snowfall in the contiguous 48 States was mostly limit-

ed to high mountains or extreme northern areas. St. Cloud, Minn., recorded 3.2 inches on the 19th, the second greatest May snowfall there during a 79-year record.

SUMMER--Temperatures averaged below normal east of the Rocky Mountains and above in the West. Departures from normal as much as 2° included only a few small scattered areas. June was warmer than normal except relatively cool in a few western areas. The reverse was true for July, while August was abnormally warm in New England, the northern Great Plains and Far West, and relatively cool elsewhere. The highest summer temperature, 124°, occurred in the southwest desert during both July and August.

Precipitation for the summer months was above normal in most of the Pacific Northwest, the southern half of the area east of the Rockies, and parts of the middle Atlantic and New England States. Only a few small scattered areas in the west and another near Lake Michigan had less than half normal. Summer totals exceeded 8 inches from the eastern Great Plains to the Atlantic coast ranging up to 20 inches or more in the Southeast.

June temperatures were persistently above normal in the upper Mississippi Valley and most of the Great Lakes region. This was the hottest June in Iowa since 1956 and the hottest in southeast Wisconsin since 1933. In Wisconsin temperatures in the middle and high nineties with high humidity produced very uncomfortable weather. Below normal temperatures persisted in the Pacific Northwest where Olympia, Wash., experienced its coolest June during a 30-year record and Helena, Mont., recorded a late-season low of 33° on the 29th.

Precipitation during June was above normal in the Pacific Northwest; parts of the Great Plains, and much of the Southeast. Less than half the normal amounts fell in the Rocky Mountains and Southwest, east Texas, and large portions of Illinois and Indiana. Most of the month's precipitation was the thundershower type. Many of these thunderstorms were associated with damaging hail, winds, heavy rains, and tornadoes, particularly in the midcontinent area. July temperatures averaged above normal in extreme southern Florida, and parts of Texas through California to Washington, and below normal elsewhere. The main temperature feature of the month was the persistently below normal temperatures in the central and upper midcontinent area. Abnormally cool weather prevailed in the upper Great Plains virtually throughout the month and from the Appalachians to the Rockies the second half. This cool weather regime was climaxed during the last week by advection of cool air over the entire midcontinent area, and weekly averages ranged from 9° to 12° below normal in most of the Great Plains region, the upper Mississippi and lower Ohio Valleys, and the Great Lakes region. This was one of the coolest Julies on record in the north-central United States, and it was the coolest at many individual stations. Among these were Fargo, and Bismarck, N. Dak., coolest in 67 and 56 years, respectively; and Dubuque, Iowa, coolest in 120 years. More remarkable, however, was the great number of stations reporting record lows for July during the last week. In Nebraska at least 45 stations reported new record lows, and frost was observed in many sections of the Sandhills and at some northeastern locations. A reading of 29° at Agate on the 30th was the lowest temperature for July ever recorded in Nebraska, and 36° at Oakland, Iowa, on the same date was among the lowest for July in that State. Fort Smith, Ark., and Oklahoma City, Okla., both recorded 53° on the 31st, new lows for July during records dating back 89 and 81 years, respectively. Farther west, Helena, Mont., reported its third coolest July in 91 years, and in the east, Albany, N. Y., had its second coolest July in 111 years. The first decade was unusually cool in the Pacific Northwest, and on the 7th, Spokane, Wash., recorded a 91-year low of 38°. The month was unusually warm in the Southwest where Winslow, Ariz., had its second warmest July in 83 years. A number of record highs in that area included 105° at Pueblo, Colo., on the 11th and 12th, and 109° at Winslow, Ariz., on the 13th.

Precipitation during July was fairly well distributed east of the Rockies and was generally adequate for most purposes. A notable exception occurred in Texas where rains the first and last weeks were limited in extent and for most of the State severe to extreme drought continued and even intensified in south-central and upper coastal sections.

Heavy downpours caused many damaging flash floods east of the Rockies. A number of these occurred in the central Great Plains early in the month, in Kentucky on the 18th, in central and eastern Kansas on the 22d and 23d, and at Meridian, Miss., on the 30th.

Temperatures for August averaged above normal in New England and west of a line joining western Minnesota and southeast Arizona and below normal elsewhere. This temperature pattern persisted through the first half and last week, but for the week ending the 21st, the northern two-thirds of the country was relatively warm, and the southern one-third cool.

Relative to normal, the southern Great Plains was the coolest area. In Texas, Port Arthur had its coolest August in 55 years, Midland in 41, and Amarillo in 51 years, and Oklahoma City, Okla., reported its coolest August in 21 years. The temperature failed to reach 90° for the first time in 51 years at Nashville, Tenn., and in 76 years at Greensboro, N. C., where the month was the coolest in 42 years. Erie, Pa., had its coolest August in 98 years. Temperatures in the upper Rockies and Pacific states were well above normal, 9° above in north-central Montana. Medford, Oreg., recorded 101° on the 11th, the highest in 29 years. Havre and Great Falls, Mont., had their warmest in 92 and 78 years, respectively. A high of 118° at Red Bluff, Calif., on the 10th was a record high for any month.

Precipitation for August was above normal in parts of nearly all the coastal and southern border states, 200 to 400 percent in much of Texas and over 200 percent in New Jersey and adjacent areas of Pennsylvania, Maryland, and Delaware. Rainfall was heavy in many sections from Texas and the lower Mississippi Valley to New England during the first week, in parts of Texas, Oklahoma, Florida, and Wisconsin the second week, in parts of the extreme Southeast and some other small scattered areas the third week. Heavy rains along the Atlantic Coast the last week occurred during the passage of Tropical Storm Doria, and locally heavy thundershowers occurred elsewhere east of the Rockies and in the Southwest.

Cool, wet weather in Texas eased the severity of the drought in all sections of that State with greatest improvement in the South. Damaging flash floods occurred along several Texas streams as a result of heavy downpours ranging up to as much as 11 inches in 24 hours.

Heavy thundershowers in Arizona were responsible for near record to record totals for August in some localities. Prescott reported 10.51 inches, a new Au-

gust record and the second greatest amount for any month since 1898; and 6.22 inches at Casa Grande was a record for August since 1880.

Although rainfall was near to mostly above normal throughout Florida, one of the worst droughts in 40 years continued along the lower east coast. The State Climatologist for Florida stated that a contributing factor to the critical drought in the area was the lack of daily rainfall amounts great enough to allow moisture to reach sub-surface water tables.

Less than half the normal rainfall was recorded in the central and upper Great Plains and middle Mississippi Valley. In Iowa, precipitation was only 30 percent of normal and the driest August, statewide, in 99 years. Parts of Kansas were the driest of record and five stations in the State reported no precipitation at all. Some stations in Nebraska had their driest August and two stations reported only a trace of rain.

AUTUMN--Temperatures for autumn averaged from 1° to 4° above normal in the eastern half of the contiguous United States and 1° to 4° below in the western half. The temperature patterns and magnitude of departures for both September and October were very much like the seasonal, but November was somewhat cooler in the East and somewhat warmer in the West.

This was a wet autumn in the Great Plains, Rocky Mountain, and middle Atlantic States. Some areas in the Great Plains and Rocky Mountains had 200 percent of normal. Several Tropical Storms brought heavy rains to the Gulf and Atlantic Coasts. Only a few small scattered areas had less than half the normal amounts, and most of these were in Michigan, Montana, and California.

September temperatures averaged above normal in the East, and below in the West except above in western California and extreme southwest Arizona. The warmest area, relative to normal, extended from the upper Mississippi Valley to the Atlantic coast with departures as much as 4°, and the coldest area included the northwest Rockies and the extreme northern Great Basin where departures were 6° or more. The few temperature records set during the month consisted mostly of late-season highs in Kansas and Nebraska on the 7th, and at others in California and Nevada near midmonth. For San Francisco a high of 101° on the 13th equaled the highest of record. In contrast, this was the coldest September in 70 years at Flagstaff, Ariz., and an early-season low of 33° was recorded by Roswell, N. Mex., on the 20th.

Precipitation during September was near normal to much above over most of the contiguous United States. In scattered areas across the country monthly totals ranged from 150 to 200 percent of normal. Frontal systems, thunderstorm activity, and tropical storms all contributed to the generous precipitation.

During the first few days of the month a low pressure system produced heavy precipitation in the Pacific Northwest and a few days later in the northern and central Great Plains. During the period, 11th to the 13th, five Tropical Storms were going at the same time. A weak tropical depression in southeastern Louisiana on the 5th produced 6 to 7 inches of rain in that area and lesser amounts in other Gulf Coastal areas, and then moved back southwestward over the Gulf where it gained hurricane intensity before reaching southern Texas near Freeport on the 10th. In southern Texas, the storm, now Hurricane Fern, produced up to more than 20 inches of rainfall that resulted in destructive floods, and spawned a few tornadoes.

During a frontal passage across the eastern states on the 11th to 13th, heavy rains totaling from 9 to 13 inches in northeastern Maryland and up to 15 inches in northern Delaware caused damaging flash floods.

Hurricane Edith moving northeastward from the western Gulf area and producing 6-foot tides along the Texas coast finally reached land in southwestern Louisiana on the 16th. Heavy rains fell in southern portions of that State and Mississippi, much of Alabana, and central and northern Georgia as the weakening storm pushed northeastward. Several tornadoes occurred in Louisiana and Mississippi.

Tropical Storm Olivia off the west coast of northern Mexico in the closing days of the month brought beneficial showers to Arizona and New Mexico.

Hurricane Ginger crossed the North Carolina coast near Morehead City on September 30, weakened rapidly, and passed into southern Virginia on October 2, and then out over the Atlantic.

Snowfall was observed the first week in the northern Rockies, and unusually heavy snow fell on the western slopes of the Rockies the third week, particularly in the Colorado area. Boulder and Denver recorded up to 14 or 15 inches. Some light snow fell in the northern Plains. Four inches fell at Harrison, Nebr., on the 21st. Near the end of the month snow fell in the Northwest, and 4 inches at Salt Lake City was the second time in September measurable snow fell there in 40 years.

October temperatures averaged 3° to 6° above normal in much of the eastern half of the contiguous United States and a like amount below normal in the western half. This was one of the warmest Octobers on record east of the Mississippi River; the warmest in 101 years in the Nation's Capital; in 22 years in Atlanta, Ga.; tied with 1920 as the third warmest in Boston, Mass., in 142 years; and was the second warmest in Rochester, N. Y., in 101 years. In the East, Indian Summer type weather prevailed during most of the second half.

The month was unusually cold in the West, particularly in southern portions where a number of stations had their coldest October in more than 50 years. More notable, however, was a record-breaking cold spell during the closing days when many stations throughout the West reported their lowest temperatures for October in many years, some stations with records dating back 80 years or more. Among the stations with at least 80 years of record reporting new October lows were: Salt Lake City, Utah, 16° on the 30th; Yuma, Ariz., 35° on the 30th; Bakersfield, Calif., 19° on the 30th; Reno, Nev., 8° on the 29th; and Fremont, Oreg., -9° on the 29th, the lowest temperature ever recorded in Oregon during October.

Precipitation was above normal along the East Coast, in the Great Plains, and in the Rocky Mountain states. This was the wettest October in North Dakota where precipitation ranged from about 200 to 600 percent of normal, some stations measuring over 5 inches for the month. Minnesota, New Jersey, and North Carolina also had their wettest October, and Kansas its second wettest.

October was unusually dry from the Mississippi River to the Appalachians, with precipitation less than 50 percent of normal in much of this area. Fall harvesting operations made good headway in the Corn Belt. Monthly precipitation totals also were well below normal in the Pacific States western portions of Montana and Idaho, and most of central Colorado and eastern Wyoming.

October snowfall was unusually heavy in parts of the West where the month was abnormally cold. Walla Walla, Wash., measured 2.5 inches, most in 99 years; Salt Lake City, Utah, 16.6 inches, most in 87 years; Flagstaff, Ariz., 24.7 inches, most in 73 years; Lander,

Wyo., 39.9 inches, most in 80 years; and Rapid City, S. Dak., 10.2 inches, most in 52 years.

The heaviest snowfall during October occurred during the last week when near-record amounts were measured in northern portions of the Rockies and Great Plains and heavy amounts in most of the higher mountain areas of the West. Six to 10 inches were reported in the mountains of Oregon. As much as 2 feet fell in the Black Hills of South Dakota. In parts of northern Utah snow accumulations exceeded 20 inches. Blizzard conditions occurred in central and southern Wyoming during the heavy snowstorm over the State on the 27th through the 29th.

Temperatures for November averaged near normal in the entire contiguous United States, slightly below in the Appalachian region and much of the Northeast and in a large western area including most of Wyoming, Utah, Nevada, California, and Arizona, and slightly above normal elsewhere. Temperature variations during the month seldom were extreme and few records were set.

In New England below-normal temperatures persisted after the first week, resulting in the coldest November in 67 years at Concord, N. H. During the second week when the weather was dry and sunny in the Great Plains, temperatures rose to unusually high levels and 83° set a new November record at Pueblo, Colorado, on the 11th. Temperatures rose to unusually high levels along the east coast in a southerly flow of air in advance of a cold front at the beginning of the month, and 83° at Wilmington, N. C., equaled the highest for November there in 101 years. These high temperatures in the East were followed by a period of abnormally cold weather, and on the 9th, Albany, N. Y., recorded an early-season low of 11°.

November precipitation, relative to normal, presented a very irregular pattern across the Nation. Areas with above-normal amounts included most of the Pacific Northwest, a broad belt extending from northern New Mexico and southern Colorado through the central and upper Great Plains and upper Mississippi Valley, a portion of south-central Texas, the Appalachian region, and the Atlantic Coastal States from Delaware to Massachusetts. Most other areas had less than normal, and an area extending from Indiana to northern portions of Alabama and Mississippi, a considerable portion of the central and northern Rockies, the southwestern desert and the southern half of California had less than half normal.

A few stations reported unusually heavy amounts. Dodge City, Kansas, measured 3.75 inches, the most for November in 97 years; and Huron, S. Dak., 2.04 inches, the most in 90 years.

Snowfall was unusually heavy for November in many northern areas, particularly during the second half of the month.

In the Cascade Mountains of the Northwest, frequent snowfalls accumulated to several feet in the higher mountains. In the East, some heavy snows fell in the lee of the Lakes, at the end of the first week, portions of the Cleveland, Ohio, area reporting nearly a foot on the ground and some locations in western New York up to 8 inches.

Cold weather which overspread the eastern part of the Nation in the closing days of November persisted with even lower temperatures during the first few days of December, and advection of cold air reduced temperatures to below normal levels in central and western areas. Subzero minima occurred in extreme north-central and northeastern areas and at high elevations in the northern Rockies.

Unusually cold weather persisted in western areas during the next 2 weeks but became unusually mild in the East during that period. Subzero minima reached into the southern Rockies and sometimes maximum temperatures along the north-central border did not rise above zero. In contrast, daily maxima in the eighties were the rule in Florida, and the mild sixties occurred as far north as southern New England.

Light to heavy precipitation fell across the Nation the first few days of November as rain in southern areas and along the Pacific coast and snow in northern interior and mountainous areas. A severe storm in the West on the first day of the month brought nearly a foot of snow to portions of the southwestern Great Plains, and heavy rains in the Gulf states as it moved across that area to the Atlantic. From northern Georgia to southern Virginia freezing rain and snow made highway travel hazardous. Charlotte, N. C., measured an early-season snow cover of 8 inches on the 3d, and depths up to 18 inches were reported in the Carolina mountains.

For the week ending December 12, cold, stormy weather with occasional blizzard conditions in northern interior areas prevailed over the western half of the Nation. Heavy rains ranging from 4 to 8 inches or more from northeast Texas to Tennessee and southern Illinois caused flooding along numerous streams.

Abnormally cold, snowy weather in the West during the week ending the 19th continued to increase the mountain snowcover. Rainfall was again heavy from the Great Lakes to the Gulf. An outbreak of tornadoes in the Midwest on the 15th killed one person in Springfield, Mo., injured several in Poplar Bluff, Mo., and caused widespread damage in northeast Arkansas.

SEVERE STORMS--Severe storms took the usual toll of life and property. Storms took more than 500 lives and were blamed for nearly 5,000 injuries. Property losses were measured in the hundreds of millions.

Tropical storms took only eight lives, but caused property damage estimated at $212.58 million. Four hurricanes entered the United States. The first, Doria, crossed into North Carolina on the afternoon of August 27. The combination of Doria and a front along the coast produced heavy rains and flooding from North Carolina to New England. Greatest damage, $138.5 million, occurred in New Jersey, but New York reported $4.32 million and New England $4.5 million. Total damage from this storm was estimated at $147.35 million.

Hurricane Edith entered Louisiana September 16. Most losses from the storm occurred in this State, amounting to about $25 million. Edith spawned several tornadoes in Louisiana and caused heavy rains in parts of Mississippi, Alabama, and Georgia.

Fern, as a weak LOW, moved up across the Gulf to southern Louisiana where she produced 6- to 7-inch rains before turning back southwestward across the Gulf. She became a Tropical Storm on the 7th and a hurricane on the 8th. Fern crossed the Texas coast near Freeport on the 10th in a southwestward course that took her across southern Texas into Mexico. Heavy rains that ranged from 15 to 26 inches in an area north and west of Corpus Christi resulted in devastating floods. She also spawned five tornadoes. Total damage in Texas was estimated at $30.23 million.

Hurricane Ginger entered North Carolina near Moorehead City on September 30, crossed into southern Virginia on October 2 and then turned out over the Atlantic. Winds and rain caused heavy crop damage in coastal areas.

Tornadoes were more numerous than usual, around 800 by the end of October. One of the earliest outbreaks of these storms occurred in Mississippi on February 21 when 107 persons were killed, 1,514 injured, and damage estimated at $17 million.

A single tornado in May cut a path of destruction through western Tennessee. Three persons were killed, 137 injured, and losses were estimated at $5,750,000.

A windstorm of unusual severity and accompanied by hail swept the southwestern quarter of Tennessee early on April 23, damaging property and crops to the extent of $25 million or more.

One of the many damaging hailstorms of the year occurred on May 5 in San Antonio and west-central Bexar County, Texas, causing damages estimated at $6 million. Another of these storms with hail to golf-ball size caused 50 to 100 percent destruction to 250,000 acres of field crops in southeastern Missouri on July 15. Total losses were expected to exceed $17 million.

Numerous flash floods occurred during the year, each causing heavy losses. On August 1-2 one of these occurred in the Baltimore, Maryland, Metropolitan area, including Harford County. Severe thunderstorms associated with a frontal system produced rainfall totaling 7 to 12 inches in 12 hours. Fourteen deaths and property damage totaling $6.5 million were blamed on the storm.

On September 11-14 during the passage of a cold front across the eastern United States severe thunderstorms in southeastern Pennsylvania produced 8 to 14 inches of rain. Resulting damage was estimated at $17 million, and 16 persons lost their lives.

EXCESSIVE PRECIPITATION

(Excessive Short Duration Rainfall)

YEAR 1971

This table contains statistics of maximum amounts of rainfall during the calendar year 1971. Data presented in this table are generally from stations equipped with recording gages. Stations are at airport locations unless otherwise shown.

Excessive precipitation data for the years 1896-1935 inclusive, generally present the accumulated amounts of precipitation for each 5, 10, or 20 minute intervals during storms in which the rate of fall equaled or exceeded .25 inch in any 5 minute period, or .30 in any 10 minute period, or .35 in any 15 minute period, etc., the tabulation beginning with the 5 minute period where the rate of .05 inch in 5 minutes began and continuing by 10 or 20 minute intervals up to 120 minutes. A detailed explanation of the method used may be found in the publications listed in the last paragraph of this explanation.

The present method, adopted with data for the calendar year 1936, gives the maximum fall of precipitation for the periods 5 to 180 minutes, the maximum amounts being taken for the periods in which the fall is greatest for the given time, and is tabulated to show maximum amounts for 5, 10, 15, 20, 30, 45, 60, 80, 100, 120, 150 and 180 minutes, even if the fall does not equal the excessive rate for some of the periods. (The 15 minute amount was not computed for 1936-43 and the 150 minute amount was not computed for 1944 through 1948).

The following Table A shows limits at which precipitation was considered excessive in this publication:

TABLE A

Duration (minutes)	Depth of precipitation (inches)	Duration (minutes)	Depth of precipitation (inches)
5	.25	60	.80
10	.30	80	1.00
15	.35	100	1.20
20	.40	120	1.40
30	.50	150	1.70
45	.65	180	2.00

This table is made up from the formula, $A = t + 20$ where A is the accumulated depth in hundredths of inches and t is the time in minutes.

For the years 1936 through 1948 stations in North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee, Arkansas, Louisiana, Texas, Oklahoma, and San Juan, P. R., used the limits shown in the following Table B:

TABLE B

Duration (minutes)	Depth of precipitation (inches)	Duration (minutes)	Depth of precipitation (inches)
5	.40	60	1.50
10	.50	80	1.90
15	.60	100	2.30
20	.70	120	2.70
30	.90	150	3.30
45	1.20	180	3.90

This table is made up from the formula $A = 2t + 30$. Its use, however, was discontinued at the end of 1948 and Table A is used by all sections for 1949 and the following years.

Publication of Data. A summary of maximum precipitation data for the years prior to 1896 is published in the annual report of the Chief of the Weather Bureau for 1895-1896. Excessive precipitation data for the period 1881-1896 are published in the annual report of the Chief of the Weather Bureau 1896-1897. Data for the years 1897 through 1934 have been published in the appropriate annual reports of the Chief of the Weather Bureau. For the years 1935 through 1949 these data are published in the appropriate issue of the United States Meteorological Yearbook. For 1950 and succeeding years, excessive precipitation is presented in the annual issues of the Climatological Data National Summary.

Data from airport unless otherwise specified.
U Indicates Urban sites.
R Indicates Rural sites.
M No record
T Clock malfunction
* Maximum of record for this duration and station. Period of record is that compiled in Weather Bureau Technical Paper No. 2, revised, plus 1962 and 1963 data. New records are denoted only for 5, 10, 15, 30, 60, 120, and 180 minutes. The continuity of record at stations that have changed location is described on page 2 of the above reference.
District of Columbia - See Virginia.

CORRECTIONS : September 17, 1969 and January 22, 1970 - Airport Data improperly entered under Portland U.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed 'Greatest in 24 hours' are computed on a 24 hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column 'Fastest Mile' is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which 'Fastest Mile' data can be evaluated.

• And also on an earlier date or dates.

• Includes all forms of frozen precipitation, except hail occurring alone.

B Number of days maximum 70 F or above for Alaskan Stations.

Y Peak gust.

V Sun below horizon November 19 - January 23, inclusive.

X Sun below horizon November 24 - January 17, inclusive.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed 'Greatest in 24 hours' are computed on a 24-hour basis without regard to calendar day - data may include precipitation with a measurable amount from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column 'Fastest Mile' is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which 'Fastest Mile' data can be evaluated.

Data in this table are obtained by conversion from data in the English Units table.

† Includes all forms of frozen precipitation, except hail or ice pellets alone.

+ And also on an earlier date or dates.

R Number of days maximum 21.1°C or above for Alaskan stations.

Y Peak gust.

X Sun below horizon November 19 - January 23, inclusive.

X Sun below horizon November 24 - January 17, inclusive.

* Less than 0.05.

Data from airport or from airport and Urban site records combined.
U indicates Urban, R indicates Rural sites.
Data for this table are based on records through 1971 except as indicated in notes.
Date after station name indicates last year included in summarization of data.
Normal values are based on the period, 1931-1960, and are means adjusted to represent observations taken at the present standard location.
Degree days are based on a daily average of 65°F.
For detailed periods of record see ANNUAL LOCAL CLIMATOLOGICAL DATA, 1971.
Fastest mile is the fastest speed, in miles per hour, of any mile of wind registered on an automatic recording wind instrument.
Refer to the Annual Climatological Data Table for stations reporting the fastest one-minute wind speed instead of fastest mile.

Clear Day averages 0-3 tenths sky cover, Partly Cloudy 4-7 tenths and Cloudy 8-10 tenths.
Heavy Fog includes data formerly referred to as "Dense" or "Thick". The upper visibility limit for heavy fog is 1/4 mile.
* Less than one-half.
B Number of days Maximum 70° or above (Alaskan stations).
\+ Relative humidity means for period of record through 1960.
‡ Mt. Washington excluded.
ϕ Estimated amounts during typhoon.
1/ Means and extremes are from post office location through 1962.
2/ Based on records from Urban office through January 1943; airport through June 1964.

c Relative Humidity readings 8:00 a.m. and NOON Local Time.
e Reopened 1963.
T Trace, an amount too small to measure.
x Sun below horizon continuously Nov. 19 - Jan. 23.
v Sun below horizon continuously Nov. 24 - Jan. 17.
(x and v)-Yearly totals for period sun above horizon.
m Mean wind speed record for 1949-1951, 1958-1962.
@ Includes all forms of frozen precipitation, except hail occurring alone.
r Resumed 1965.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.
These are the elevations of the barometer (in feet and meters above mean sea level) to which station pressure values pertain in the "Climatological Data" table in the monthly publication CLIMATOLOGICAL DATA NATIONAL SUMMARY

GENERAL SUMMARY OF TORNADOES, 1971

Norman E. Poultney
National Climatic Center
Environmental Data Service
National Oceanic and Atmospheric Administration

The 1971 tornado season began on January 3 at 3:30 p.m. in Hollywood County, Arkansas, when a tornado touched down near Symrna Church. The season ended on December 31 when a waterspout moved inland at Kaumakani, Kauai, Hawaii. Between these two dates a total of 888 tornadoes was reported on 192 days, killing 156 people, injuring 2,770, and causing property losses in excess of $50 million. This was the greatest death toll since 1965 when 298 were killed. The April through July peak season accounted for 61 percent of the annual tornado total.

The 1971 tornado output was the third highest since 1953, when the current reporting practice began, being exceeded only by 1967 with 912 and 1965 with 899. Only Alaska, Delaware, Idaho, New Hampshire, Rhode Island, Vermont, Puerto Rico, the U. S. Virgin Islands, and the Pacific Area escaped these devastating storms. The greatest number of tornadoes on a single day, 32, occurred on December 14 during the usually "quiet" time of the year. Some of the more damaging tornadoes are described briefly in the following paragraphs.

JANUARY -- A fast-moving cold front and associated squall line spawned nine tornadoes in southern Georgia on the 15th, killing one person, injuring six, and causing many thousand dollars' worth of property damage. A waterspout swept inland at Kailua Bay, Hawaii, injuring four people and doing damage estimated at $1.5 million.

FEBRUARY -- February 1971 produced 83 tornadoes, nearly twice the number of any February since 1953. The Mississippi Delta Tornadoes of the 21st was the most disastrous tornado episode of the year. On this date, four major and at least five lesser twisters killed 110 people in Mississippi and 11 in Louisiana. Injuries in the two states were 1,511 and 18, respectively. The small Mississippi communities of Delta City, Inverness, Little Yazoo, and Pugh City were virtually destroyed. Damage was estimated at $20 million.

The earliest funnel touched down near Delhi, Louisiana, about 3:00 p.m., passed through Joe's Bayou, wiping out a family of 11, and moved northeastward into Mississippi. It swept northeastward through Issaquena to Leflore Counties in Mississippi, leaving a death toll of two at Cameta, seven at Delta City, two at Isola, 21 at Inverness, and four at Moorhead. The total length of the path of this tornado in the two states was about 110 miles, the width about 1/2 mile and the forward speed about 50 m.p.h. The death toll was 36 in Mississippi and 11 in Louisiana.

The second killer tornado descended near Filter in Issaquena County and swept northeastward, lifting near the Tallahatchie River only to descend again southwest of Bethlehem and continue a short distance over the Tennessee line where it wrecked three houses valued at $40,000. Along this line 14 lives were lost at Cory, seven at Gooden Lake, two at Mound Lake, 21 at Pugh City, two at Swiftown, six at Morgan City, two near Greenwood, and four at Money. The path was apparently continuous from Filter to near Abbeville with several skips thereafter, a total of nearly 198 miles. The total known deaths in this tornado was 58, the greatest for one tornado in 1971.

The third of this fearsome quartet touched down only briefly from north of Drew to near Rome. It wrecked several houses and a cotton gin and cost three people their lives.

The last major Mississippi Delta tornado damage track extended from south-southwest of Bovina through Little Yazoo to near Lexington, a distance of about 69 miles. The forward speed was nearly 54 m.p.h. Near Bovina it demolished a house and deposited a man and his wife, fatally injured, in a field across the road. It claimed 10 more lives at Little Yazoo and one at Bentonia.

At least five other touchdowns occurred on this date in Hines, Benton, Rankin, and Pontotoc Counties. None of these caused extensive damage except the one in Pontotoc County where school buildings, two stores, and a church sustained damages estimated at $72,000.

APRIL -- On the 27th, an outbreak of seven tornadoes, apparently associated with a passing cold front, struck Kentucky. Four of these were noteworthy. Two tornadoes which followed parallel east-southeast paths occurred at 6:10 and 7:20 p.m. The first extended from near Wysox for about 25 miles with some skips. Near Schultztown, an asphalt shingle was driven 2 inches into a large oak. The sister tornado followed a discontinuous path through Muhlenberg, Butler, and Warren Counties, killing one occupant of a trailer. Between them, these two storms destroyed 33 homes, heavily damaged 42 homes and four trailers and injured 20 people. At 8:30 p.m., a tornado descended near Bramlett in Green County and moved over a 15-mile east-southeast path through Adair County. Six persons were killed and 58 injured. Later, at 9:30 p.m., another tornado hit Russell and Pulaski Counties, injuring 70 in Russell and two in Pulaski. Near Gosser Ridge, two people died when their farmhouse was destroyed. In Russell County, 35 houses and three mobile homes were destroyed and 105 homes damaged. A school suffered $150,000 damage and numerous trees and powerlines were downed.

Georgia reported 14 tornadoes, nine of which occurred on the 23d. One person was killed and 27 injured. Texas observed 24 tornadoes on 6 days, one of which struck Hereford injuring 24 and causing $3 million damage. It was the first tornado in Hereford's history.

MAY -- May saw the usual increase in tornado activity, producing 165 on 24 days, killing seven people and injuring 335. Iowa had its first tornado outbreak of the year on the 5th when three were reported, one of which struck Conway, demolishing 10 homes and damaging or destroying 45 buildings in the town. In Missouri, a multiple-funnel storm near Rothville injured six people and derailed 67 freight cars. The force of the wind rocked a 250,000-pound locomotive. Another funnel touched down in the southwest corner of Joplin and moved through the business district and out into the country. One college student was killed while seeking shelter and 60 other persons were injured. Damages to homes and businesses were estimated at over $2 million. A twin-funnel storm hit Marceline along a 1/2-mile path, destroying three homes and four mobile homes and damaging 22 homes and 200 other structures.

On the 7th a tornado hit near Bradford, Tennessee, and travelled to the vicinity of Cuba Landing, nearly 50 miles. Three fatalities were reported and 137 persons were injured. Damages were estimated at over $5.7 million. Another tornado on the 24th struck north of Memphis injuring 22 people and causing $250,000 damage.

Texas reported 27 tornadoes on 11 days. On the 23d, three out of a total of five funnels touched down in the Whitney-Whitney Lake area. One trailer resident was killed and another couple hurled 200 yards through the air and seriously injured when their mobile home disintegrated. In all, 49 persons were injured and property losses were set at $525,000.

JUNE -- This was the second most active June since

1953, with 199 tornadoes reported on 28 days. Despite all this activity, only one death was reported. Eldorado, Iowa, suffered one casualty on the 24th.

Texas recorded 33 tornadoes on 13 days. Seven of these touched down within a 30-minute period on the 5th in Hutchinson County, but did little damage. About 5 p.m., on the 9th, nine funnels, at least four of which reached the ground, were observed near Sunray, Sherman County. Damage was light because they hit open farm and ranch land. At 7 p.m., another was seen near Morse, which obligingly remained nearly stationary for 25 minutes to be photographed. The largest tornado on record in Texas touched down southwest of South Gruver and followed a 15-mile meandering course with a width of 2 miles at times. The parent cloud was not large and the display was clearly observed by many people, one of whom said, "There were the most funnels I've ever seen in my life. I'd judge between 15 and 20----." Despite its great size, damage was estimated at only $15,000 because it struck open land. No deaths or injuries were recorded. At least one other funnel touched the ground.

JULY -- July saw 100 tornadoes on 30 days, few of which were of note. Northeastern Iowa experienced an outbreak of five tornadoes on the 12th. In Worth and Mitchell Counties the first twister severely damaged 15 farmsteads causing over $150,000 damage and destroying over 5,000 acres of grain while another damaged 55 homes in Fayette. Losses in Fayette County were set at $1 million. Three tornadoes visited Maine on the 31st. Near Turner, an 8-month-old baby and her sitter, who were in a trailer which exploded when hit, were found unharmed 200 feet away. An occupant of another completely demolished trailer found himself running in an open field with no recollection of how he got there. Five of nine funnels set down and traveled skipping paths through Hand, Beadle, Buffalo, and Jerauld Counties in South Dakota, damaging a number of buildings. Losses were about $30,000.

AUGUST -- Fifty tornadoes were reported in August on 21 days. No deaths were reported; 46 were injured. At 5:45 p.m., on the 30th, a tornado swooped down southwest of Tempe, Arizona, and moved northeastward, demolishing many houses and damaging others. Forty-one people were injured, none seriously. Northeast of Flint, Michigan, a tornado struck a new trailer park, destroying 20 trailers and some nearby buildings. One injury was reported. Damage was estimated to be in excess of $150,000. In Texas, 20 out of a reported 115 funnels contacted the ground on 9 days. Touchdowns were in open country and damage was slight.

SEPTEMBER -- Tornado activity slackened off only slightly in September when 47 were observed on 15 days. Alabama reported five, causing mostly minor damage, and Louisiana reported seven, six of which were spawned by Hurricane Edith. One of these, in East Baton Rouge Parish, damaged a church, a high school, a shopping center and over 300 homes. In Texas, five of the seven tornadoes reported were progenies of Hurricane Fern. Two severe tornadoes struck central Wisconsin on the 28th. The first cut a swath through Chippewa, Clark, Marathon, and Lincoln Counties injuring five people and causing about $2 million worth of damage to buildings, livestock and crops. The second passed from Marathon County to Marinette County, injuring five people. Most of the damage was at Mountain, estimated at $200,000. Both of these storms traveled about 75 miles and were about 300 yards wide.

An interesting side light was a fire-whirl near Morley, Minnesota, which behaved rather tornadolike. It originated in a brush fire, whirled across a lake, raising a frothy funnel, upsetting an 1,800-pound boat, and crashed into the woods on the opposite shore.

OCTOBER -- Still fewer tornadoes were reported in October; 38 on 12 days with no deaths and 25 injuries. On the 17th, a tornado struck Wray, Arizona, injuring nine people in a trailer court, destroying five business buildings and damaging 50 to 60 other buildings and homes. A cluster of six tornadoes struck Lamb, Castro, and Hale Counties in Texas on the 17th. Four persons were injured by these storms, none seriously. The first covered a 35-mile path 100 yards wide and damaged four rural homes. The second, and most violent twister, cut a 400-yard-wide "snake-like" path at a forward speed of 50 m.p.h. At one farm it struck so suddenly that the family could not reach their storm cellar and sought shelter in a bedroom of their house. The couple and two of their children were hurled 50 feet and landed near some trees on their own mattresses. One child was injured. The third followed a path almost identical to the first, trailing it by 45 minutes. The other three caused minor damage. Total damage was $430,000 to property and $300,000 to crops.

NOVEMBER -- Fifteen tornadoes on 7 days were recorded in November. There were no deaths and 12 injuries. A tornado struck the Mid City Shopping Center in Portsmouth, Virginia, moved on an intermittent path by the U. S. Naval Hospital, then jumped to downtown Norfolk where it damaged the new Cultural Complex. Eleven injuries were reported.

DECEMBER -- A late season outbreak of tornadic activity occurred when 43 were observed on the 14th and 15th. Two waterspouts moved inland at Kaumakani, Kauai, Hawaii, bringing the 1971 Hawaii tornado total to four. Hawaii had reported only five since 1953. Texas was hit by 23, all on the 14th. A tornado hit Bushton, Illinois, on the 15th, damaging 80 percent of the homes and injuring 24 people. A tornado struck Missouri late on the 14th on a 49-mile path from Billings to Buffalo, passing over the Springfield Airport where it damaged 35 planes. The Weather Service barograph dropped from 27.83 inches to 27.52 inches, then jumped to 27.91 inches in about 3 minutes. The anemometer cups blew off at about 105 knots. One fatality and 22 injuries were reported. A few hours later, on the 15th, a tornado touched down at Bell City, Missouri, and passed through Mesler, Oran, Illmo, and Scott City killing one person and injuring 26.

Additional information is contained in the tables and tornado track chart on the following pages.

NORTH ATLANTIC TROPICAL CYCLONES, 1971

Richard M. DeAngelis
Environmental Data Service, NOAA
Silver Spring, Md.

The 1971 North Atlantic tropical cyclone season will be remembered for several reasons. It featured the longest-lived hurricane on record--Ginger. Two storms had double lives; Chloe and Irene became Lily and Olivia in the eastern North Pacific. And during the Texas floods of Fern, a horse drowned in the living room of one home while a pig survived in the bathroom of another.

From the 4th of July to the 21st of November, 12 tropical cyclones came to life in the North Atlantic region; five became hurricanes; five crossed the U. S. coast. In the United States, there was an estimated $212.58 million damage and eight persons lost their lives. Hurricane Edith produced the highest sustained wind of 140 knots and the lowest pressure of 943 millibars. Both occurred off the Nicaraguan coast. Six tropical cyclones formed in September, and from the 11th to the 13th, five were going at the same time. During the past 30 years, the average tropical cyclone season has lasted from July 6 through October 30 with an average of 10 tropical cyclones, six of which have become hurricanes. An average of three to four tropical cyclones have crossed the U. S. coast each year.

TROPICAL STORM ARLENE, JULY 4-7

Arlene formed from an extratropical frontal low which had developed about 100 miles south of Cape Hatteras. On the 5th, satellite pictures revealed a circular cloud system completely detached from the frontal cloud mass. A reconnaissance crew found 45-knot winds, a 1002-millibar pressure center, and a warm tropical core. The MOBIL MERIDIAN encountered 40-knot winds and 16-foot seas about 60 miles west of the developing storm's center on the 4th. The next day, four ships encountered 35- to 45-knot winds and 6- to 8-foot seas within 150 miles of Arlene's center. They were the BALTIMORE, ECLIPSE, MARINE FIDDLER, and FREDERICK LYKES. The storm was moving northeastward. Arlene reached peak intensity on the evening of the 6th when her central pressure dropped to 1000 millibars. The highest wind was 52 knots from a ship south of Newfoundland. On the 7th, Arlene gradually turned extratropical off Newfoundland.

HURRICANE BETH, AUGUST 10-17

Beth was spawned by an upper-level low off the east coast of Florida. As a depression, she paralleled the coast from the 10th to the 13th. During this period, conditions were unfavorable for development. However, once east of Cape Hatteras, Beth deepened rapidly. Early on the 14th, she reached tropical storm strength with a 995-millibar central pressure, and 10 hours later Beth was a hurricane generating 68-knot winds around a 990-millibar central pressure. The Norwegian ship ATLANTIC FOREST encountered gales on the 14th and 15th. The first time she was about 120 miles southeast of the storm's center, and 24 hours later, she was about 280 miles southeast of the rapidly moving hurricane. The ship was running in 13- to 17-foot swells. The ATLANTIC COGNAC at 0600 on the 15th recorded a 983-millibar pressure with 65-knot winds. The hurricane attained her greatest intensity some 200 miles off Cape Cod on the 15th when her pressure fell to 977 millibars and surface winds were estimated at 75 knots. Cooler sea and air temperatures weakened Beth as she approached Nova Scotia. She passed just off Halifax and made landfall during the afternoon of the 16th near Copper Lake where a 983.6-millibar pressure was reported at 1730 on the 16th.

Beth continued north-northeastward passing just west of Sydney, Cape Breton Island. In her extratropical stage, Beth moved across the Cabot Strait and along western Newfoundland.

Beth was responsible for record rainfall amounts in parts of Nova Scotia. Halifax recorded 9.37 inches in 39 hours. A 24-hour total of 7.28 inches was second only to a 9.40-inch total on September 21, 1942, in a similar situation. These heavy rains were responsible for damage in excess of $1 million. Elsewhere totals ranged from 3 to 5 inches, and lesser amounts fell over New Brunswick, Prince Edward Island, and Newfoundland. Winds were light throughout the area. Sustained winds of 30 knots were recorded on Prince Edward Island.

Damage to crops due mainly to flooding was extensive. Sections of highways and bridges were washed out. Fresh water supplies at Dartmouth remained contaminated for days following the storm because of excessive runoff into the supply lakes.

Total damage in Nova Scotia was estimated at $3.5 million. No fatalities were reported.

TROPICAL STORM CHLOE, AUGUST 18-25

Satellites tracked a tropical disturbance, from the African coast on the 13th, as it moved rapidly westward (20 knots) across the Atlantic. An Air Force reconnaissance crew penetrated the storm early on the 18th, some 400 miles east of Barbados, and found a 1007-millibar central pressure with 30-knot winds in the northeast quadrant. The depression reached St. Lucia on the morning of the 19th and then moved into the western Caribbean. Winds were about 25 knots with gusts to 45 to 50 knots on Barbados, Dominica, and Martinique. Heaviest rains were 5.78 inches in 13 hours at Husbands, Barbados, and 4 inches in 24 hours on Martinique. Once into the Caribbean the, as yet unnamed, depression slowed to less than 15 knots and turned toward the north-northwest. Late on the 19th, the depression became Tropical Storm Chloe as central pressure dropped to its lowest point, 1004 millibars. This intensity was confirmed the next morning by the MOBILGAS and reconnaissance aircraft as they encountered 47- to 55-knot winds. Later on the 20th, the JOSEPH P. GRACE and then the CORANTIJN encountered 50-knot winds in 20-foot seas within 100 miles to the northeast of Chloe's center. A short time later Chloe began to weaken as pressure rose to 1007 millibars and maximum sustained winds fell to 30 knots in the northeast quadrant.

On the 21st, Chloe was downgraded to a tropical depression moving west-southwestward. The depression

turned west-northwestward and moved across Swan Island on the 23d. On the 25th, she moved into British Honduras. It is believed that the remnants of Chloe developed into what was to become Hurricane Lily in the eastern North Pacific.

TROPICAL STORM DORIA, AUGUST 20-29

Doria was spawned by an African disturbance which had migrated across the Atlantic. Interest in the system was spurred by satellite pictures early on the 20th. These pictures showed an organized cloud pattern about 1,000 miles east of the Windward Islands. Reconnaissance aircraft reached the newly formed tropical depression later in the day. There was little change in this second stage of development as Doria moved west-northwestward through the Leeward Islands on the 23d and into the Bahama Islands on the 25th. Conditions improved on the 25th. The storm became better organized and generated 30- to 35-knot squalls northeast of its center. On the afternoon of the 26th, a definite 1008-millibar center was found about 100 miles north of the Bahamas. The depression was named Doria, and a few hours later, was a tropical storm. She plodded northward and deepened 20 millibars in 24 hours.

Early on the afternoon of the 27th, Doria crossed the North Carolina coast, west of Morehead City (near Emerald Isle). Just prior to landfall, her central pressure reached its lowest point, 989 millibars. About this time, the DOCUMONTE encountered 50-knot winds about 60 miles south of the storm's center. Doria pounded eastern North Carolina with gales and driving rain as she moved across the State and into southeastern Virginia that evening. The Outer Banks and the shores of Pamlico and Albemarle Sounds were pelted by 4- to 5-inch rains, lashed by 50-knot wind gusts, and inundated by 1- to 2-feet tides. At Atlantic Beach, close to Doria's point of landfall, winds reached 60 knots in gusts, tides were 3 to 4 feet above normal and pressure dropped to 995 millibars. Heaviest rains fell ahead of the storm, and the 4-inch totals were confined to eastern sections of the State. Damage throughout North Carolina was minor, and total property and crop estimates were set at about $150,000. There were no reports of storm-related deaths.

The day before Doria reached North Carolina, a stationary frontal trough hung over the east coast bringing rain from North Carolina to New England. The combination of this trough and Doria produced the high rainfall totals that occurred during the 2-day period. The storm rainfall amounts refer to this combination of factors.

Doria accelerated and moved northward along the Virginia-Maryland-Delaware shore during the night of the 27th. Winds over the open waters of the Atlantic were higher than those along these coasts. This was attested to by the ESSO HONDURAS which battled 50-knot winds in 20-foot seas about 100 miles east of the storm's center at 0000 on the 28th. At about the same time Norfolk, right in the storm's path, was being buffeted by 45-knot winds. Tides rose to 3.6 feet above normal at Portsmouth Navy Yard and 2 to 4 feet above normal elsewhere along the eastern shore.

Rains in the three-State area were greatest in eastern Maryland where totals of up to 9.80 inches fell near La Plata and in Delaware where Talleyville recorded 7.96 inches. Over the western Piedmont section of Virginia and most of eastern Maryland and Delaware 4- to 6-inch totals were common. A tornado touched down near Norfolk Regional Airport causing some $250,000 damage. Doria caused some additional $125,000 damage in southeastern Virginia. Damage in Delaware and Maryland was termed light. One storm-related death occurred in northern Virginia.

In the early morning hours of the 28th, Doria made her way up the Jersey shore toward New York City. It was in New Jersey that she wrought the most damage. Excessive rainfall had occurred over most of New Jersey and southeastern Pennsylvania during the 24 hours preceding Doria. Although the rainfall which could be directly attributed to Doria was less than that from the front, the combined fall in a short period of time produced devastating floods in central and northeastern communities of New Jersey and minor flooding in the southeastern counties of Pennsylvania. In the Pennsylvania counties of Chester, Delaware, Montgomery, Philadelphia, and Bucks, flash floods closed streets and caused power failures. Rainfall totaled over 6 inches in parts of the area with a 6.57-inch fall in Philadelphia and an unofficial 7.5-inch report at Kennett Square near the Delaware border. The strongest reported wind was a 63-knot gust in Philadelphia. One person was killed by a falling limb in Chester County. Damage in Pennsylvania was estimated around $300,000.

The hardest hit New Jersey communities were Bound Brook, Manville, and Elizabeth. Trenton set a 24-hour record with 7.55 inches of rain and had an 8.09-inch total. The old Trenton record was 5.42 inches during a 24-hour period in October 1903. New 24-hour marks were also set at New Brunswick and Newark. Newark was deluged with 8.01 inches of rain. Streets and highways became flooded in many areas, and mudslides blocked some roads in Middlesex County. New York to Philadelphia railway service was interrupted for some 29 hours when water flooded the Trenton station. The American Cyanamid Co. at Bridgewater suffered severe flooding. Total damage in New Jersey was estimated at $138.5 million. Of this amount $53.5 million was done to bridge, water, and sewer systems and $85 million was a result of damage to other private and industrial property. Minor damage and beach erosion resulted from the 20- to 40-knot winds and 2- to 4-feet above normal tides along the coast. Three people drowned in New Jersey.

Come Saturday morning, early-rising New Yorkers awoke to the sound of 15- to 25-knot winds and a second straight day of driving rain. Stronger winds of 30 to 35 knots with gusts to near 45 knots had occurred earlier in the morning. Before the storm was finished 5.96 inches of rain fell at Central Park, 3.69 inches at Kennedy Airport, and 5.49 inches at LaGuardia. At LaGuardia 2.29 inches fell in 1 hour on the afternoon of the 27th. The early morning tide at the Battery was 4.7 feet above normal. Out on Long Island, at Bridgehampton, winds gusted to 52 knots but rain totaled only 0.41 inch.

Heaviest precipitation occurred from New York City northward up the Hudson River Valley to the Poughkeepsie-Kingston area. Amounts ranged from 6 to 8 inches over the 27th-28th. Staten Island recorded 7.86 inches and Glenham in southwestern Dutchess County reported 7.81 inches. Suffern Water Works in western Rockland County recorded 8.55 inches. Rain totaling 4 to 5 inches fell as far north as Lake George and 2.5- to 3.5-inch totals were reported as far west as Sullivan, Delaware, and Otsego Counties, as well as in the eastern Mohawk Valley and northward through Essex County. Precipitation decreased eastward across Long Island

from the 6- to 8-inch totals around New York City to 2.5 to 3.5 inches in Nassau and northwestern Suffolk County to less than 1 inch on the eastern end of the island.

Streets, highways, and subways were flooded in New York City, and all surface transportation was greatly hampered. Similar flooding occurred on western Long Island and over much of the Hudson River Valley with small streams and creeks overflowing. Wind damage was light, and downed limbs and powerlines represented the primary source of trouble. Some 25,000 homes were without power on Long Island. Agricultural losses were light; some fruit was dislodged from trees and some corn blown over. Total damage in New York was estimated at $4.32 million.

Doria began to weaken as she headed inland over western Connecticut and western Massachusetts on Saturday morning. However, her forward speed increased to 30 to 35 knots. Strongest winds were east of her center. Bridgeport experienced a 65-knot gust. At Boston, gusts were reported at 50 knots and on top of Blue Hill at Milton, Mass., a 75-knot gust was recorded during the morning of the 28th. As far north as Concord, N. H., winds gusted to 45 knots.

While the storm surge produced tides up to 5 feet above normal, tides at the time were near their low and coastal flooding was minimal. However, high surf did batter some homes and swamp some small boats. Sightseers were out in force to admire the pounding surf. At Marblehead, Mass., a young man was drowned after rescuing two others who had been caught by the high surf.

Rain in New England was heaviest mainly west of Doria's center. The combination of the frontal system and the tropical storm produced a 5- to 6-inch band of rain from Pittsfield, Mass., to north of Brattleboro, Vt., and 6-inch totals in southwestern Connecticut. Northwestern Connecticut, western Massachusetts, and Vermont had 2 to 4 inches of rain. In eastern Connecticut, northwestern Rhode Island, central Massachusetts, New Hampshire, and central and western Maine, 1- to 2-inch totals were common; some sections of New Hampshire had 2 to 3 inches. Elsewhere totals were less than 1 inch.

In Connecticut and throughout most of New England, east of the storm's center, the ground was littered with leaves, branches, and often whole trees. Utility lines were knocked down in some areas. Some 150,000 homes were without electricity in Connecticut. Autos and buildings were damaged by fallen limbs. Vermont got little wind, but rain washed out several bridges. Total damage estimates for Connecticut and New England run from $4 to $5 million.

During the afternoon of the 28th, Doria started to turn extratropical as she tore across western Maine. That evening she raced into Canada and across the St. Lawrence River, blasting St. John, New Brunswick, with 50-knot winds; on the 29th, Gander, Newfoundland, recorded a 55-knot gust.

Total storm damage in the United States was $147.35 million, mostly the result of flooding. Six people lost their lives; three in New Jersey, one in Massachusetts, one in Pennsylvania, and one in Virginia.

HURRICANE EDITH, SEPTEMBER 5-17

From the depths of the Tropics came the season's most potent hurricane. Developing farther south than most September storms, Hurricane Edith made landfall three times during her lifetime. Nicaragua and Honduras felt her blow first and worst. Then British Honduras and the Yucatan Peninsula were stung. Finally, Edith swept ashore for the last time in Louisiana.

The powerful storm gave first indications of life near 11.5° N., 57.0° W., on the 5th. It was at this time that an exploratory reconnaissance team found a closed circulation. The normal stillness of a tropical evening on Grenada, and other islands in the southern Windwards, was shattered by torrential downpours riding 30-knot winds. The following day, coastal residents of Venezuela saw cloudiness and felt rain associated with the depression as it skimmed westward across the southern Caribbean. Edith became a tropical storm and was christened on the 7th. Less than 24 hours later, some 150 miles north of Barranquilla, Colombia, pressure fell to 993 millibars, winds reached 65 knots, and Edith became a hurricane. The real fireworks came on the 9th as the storm moved predictably west-northwestward toward Nicaragua. It was on this day that Edith, unpredictably and explosively, intensified to a great hurricane (central pressure less than 950 millibars for at least 24 hours). Her central pressure plummeted to 943 millibars. Her winds spiraled to an estimated 140 knots. She was described by reconnaissance crews as extremely turbulent. With a small, perfectly formed eye, just 5 miles in diameter, Edith was likened to a giant tornado.

Around midday on the 9th, Cape Gracias, Nicaragua, felt the awesome power of this superstorm. A decade had elapsed since this region had known the fury a hurricane could bring. Edith made her way across Honduras. As she took her toll, the land took its toll, and when Edith entered the Gulf of Honduras, early on the 10th, she was weak. A 1-day journey across the Gulf brought a minimal hurricane to the shores of British Honduras near Belize. Coastal winds surged to 45 to 50 knots on some keys, but as Edith moved ashore, her strength dwindled rapidly. She made an uneventful trip across Mexico's Yucatan Peninsula and limped into the Gulf of Mexico near Campeche on the night of the 11th. The beaten storm headed toward Mexico and showed no signs of improvement until the 13th. Then the life-restoring powers of the Gulf of Mexico began to take effect and Edith once again started to deepen. However, it looked like the end as the tropical storm headed inland near Soto La Marina, Mexico, but like a woman, she changed her mind and turned north-northeastward back out to sea. After this moment of indecision, Edith accelerated, intensified, and headed for the Louisiana coast. She regained hurricane status about 100 miles northeast of Brownsville, Tex., on the 15th. Her 978-millibar pressure center crossed the Louisiana coast in Cameron Parish, between Grand Chenier and the Rockefeller Wildlife Refuge, at about 0800 c.s.t., on the 16th. Edith moved rapidly across south, central, and eastern Louisiana during the next 6 hours. The eye passed near Lafayette at about 1000 c.s.t., 12 to 15 miles northwest of Baton Rouge shortly after noon, and into southern Mississippi near McComb by early afternoon. The storm slowed and weakened as she moved through Mississippi and across central Alabama on the 17th. By the next morning, she gave out over northern Georgia.

Edith was responsible for widespread damage in a remote and sparsely populated area of Nicaragua.

In this area, at least 28 persons lost their lives and 1,876 were left homeless. Poor roads and flooding isolated many of the villages. Food and relief supplies were flown in by United States helicopters and aircraft, in addition to the Nicaragua effort.

The Texas coast felt the fringe effects of Hurricane Edith as she moved through the Gulf of Mexico toward Louisiana. She generated tides up to 6 feet above normal in the Sabine Pass area and buffeted Freeport and Port Arthur with sustained 35-knot winds. Gusts reached 45 knots at Galveston, and pressure dropped to 1000 millibars at Brownsville. Rainfall was heaviest at Sabine Pass where 3.50 inches fell. Total damage in Texas was estimated at $180,000 of which $105,000 was to properties and $75,000 was to crops. Most property damage was in the Port Arthur area. Winter vegetables and rice, mainly in Cameron and Jefferson Counties, suffered from the rains.

As Hurricane Edith moved toward Louisiana on the night of the 15th, winds and tides increased. Highest sustained winds measured on shore were 60 knots with gusts to 83 knots at Cameron. The lowest reported pressure was 985.8 millibars at Lafayette. Storm rainfall, accumulating over a 2-day period, ranged from near 2 inches over extreme southeast Louisiana to 6 to 8 inches near and to the north of Edith's track from the west Louisiana coast northeastward to West Feliciana Parish. Two-inch totals were also common in sections of southwest, central, and northeast Louisiana, which were on the fringe of the storm.

The fast forward movement of Edith as she approached the coast caused only a moderate buildup of Gulf waters in the low-lying coastal areas. Tides ranged from near 5 feet to more than 8 feet above mean sea level. Highest storm tides were reported in Vermilion and Cote Blanche Bays.

As one of the stronger hurricane rainbands swept across southern Louisiana during the morning of the 16th, several tornadoes were reported. One moved along an intermittent 7-mile path through eastern sections of Baton Rouge, damaging two schools, a shopping center, and some residences.

Edith's damages were mostly light to moderate throughout southern Louisiana. Trees were uprooted, windows broken, billboards toppled, and mobile homes damaged. In many areas, wind and rain did considerable damage to crops. The greatest losses were to sugarcane, soybeans, rice, cotton, pecans, sweet potatoes, and vegetables. The Louisiana Wildlife and Fisheries Commission reported damage to levees, roads, and water control structures on the Rockefeller and Marsh Island Wildlife Refuges. Total damage in Louisiana was estimated at $25 million, including $20 million in crop damage and $5 million in property damage. These figures include tornado damage.

In Mississippi, maximum sustained winds along the coast and in the southeast were 40 knots with gusts to 60 knots. Storm rainfall was heaviest in the southwest where amounts of 5 to more than 6 inches were recorded. Most of this resulted from an area of heavy thunderstorms in the Liberty-Brockhaven area during the morning of the 16th. Tides along the coast were 2 to 4 feet above normal. Wind damage was light, but there was some property and crop damage in areas of heavy rainfall. Several tornadoes were reported. One substantiated tornado was seen at about 1000 c.s.t. in Attala County. A motorist saw a small funnel dip down about 1 mile northeast of Ethel. The rope-like funnel caused intermittent damage along a 600-foot path some 25 to 50 feet wide.

Rain fell on Alabama Thursday night and Friday. Totals ranged from 1 to 3 inches with heaviest amounts in the central and southern parts of the State. Except for southeastern and extreme northwestern Georgia, rainfall was 2 inches or more over that State. There were 4-inch totals over Wilkinson, Washington, Johnson, and Laurens Counties in central Georgia and over the west-central counties of Muscogee, Chattahoochee, and Stewart. Rain began on the morning of the 16th in the west, and ended early on the 19th in the east. While there was some overflow of small streams, there was no flash flooding and only minor damage.

HURRICANE FERN, SEPTEMBER 3-13

Hurricane Fern was spawned by a tropical wave that had moved out of the Caribbean in the beginning of the month. Early on the 3d, a tropical depression was located in the Gulf of Mexico near 27.5° N., 87.5° W. This depression moved slowly northwestward to north of Lake Pontchartrain by the morning of the 5th. At this point, the system turned southwestward. The depression drenched the New Orleans area with 6- to 7-inch rains. Once back over warm Gulf waters, the depression began to intensify. Fern reached tropical storm strength late on the 7th as her central pressure dropped to 1000 millibars. The intensifying storm then began to turn, and, by the following day, was heading toward the northwest and was generating hurricane-force winds near her center. Fern's central pressure was down to 987 millibars when she became a hurricane. Gale-force winds were already raking the coast from Galveston to Freeport on the night of the 9th, with Fern's center still 100 miles to the southeast. As the hurricane approached the Texas coast during the daylight hours of the 10th, she began to swing toward the southwest. Her central pressure dropped to its lowest point, 979 millibars, at 0600 c.s.t., on the 10th. Peak winds reached 78 knots. Then part of the eye passed over Freeport. It moved past Port O'Connor, near Seadrift, and was over Matagorda Island by about 1100 c.s.t. The eye continued to hug the coastline until it neared Rockport, where it slowed and began to drift inland. At about 1300 c.s.t., the eye was southeast of Austwell. By 1500, it was east of Bayside. Now a tropical storm, Fern hesitated for a few hours and then around 1910 c.s.t., her eye moved into Aransas Pass. At 2030 c.s.t, Aransas Pass recorded a 983.4 millibar pressure. By 2135, the eye had moved over Corpus Christi Bay and was drifting southwestward. At 0254 c.s.t., on the 11th, Corpus Christi recorded a 981.4-millibar pressure. The lowest reported pressure by a land station was 979.34 millibars at Ingleside. About 2-1/2 hours after eye passage, Aransas Pass was belted with an east wind of 48 knots with gusts to 68 knots. Indications are that the storm accelerated and by early morning was just south of Hebbronville. Later, the tropical storm crossed the Mexican border near Zapata. On the 13th, she finally broke up in the mountains north of Monterey.

Hurricane Fern produced only moderate tides and winds, but her heavy rainfall was responsible for destructive floods. Maximum sustained winds of 57 knots were recorded at Corpus Christi. Sustained winds ranged up to 75 knots at Port O'Connor, where a wind gage was blown away when gusts reached 87 knots. Gale-force winds were experienced from just north of Galveston to near Brownsville. Gusts of 50 knots or more were reported from Galveston to south

of Corpus Christi. Tides from Port Arthur to Brownsville ran 2 to 6 feet above mean sea level, with 5- to 6-foot levels confined to the Galveston-Freeport area. A tide 6 feet above mean sea level was observed at the U. S. Coast Guard Station at Freeport at 0800 c.s.t., on the 10th.

Fern produced heavy rains in an area north and west of Corpus Christi. Downpours from 15 to 26 inches soaked Bee, Refugio, and San Patricio Counties. Highest totals were 26.0 inches 2 miles south-southeast of Beeville, 25.8 inches 3 miles north of Skidmore, and 21.5 inches at Papalote. Totals of 10 tc 15 inches fell over Calhoun, Aransas, Matagorda, Golidad, and Dural Counties. Along the coast from Galveston to Rockport, rainfall amounts increased from 5 inches up to 12 inches. Five-inch totals extended inland as far as Houston. Amounts dwindled rapidly to 1.07 inches near Port Arthur in the north and to a paltry 0.02 inch at Brownsville. Fern was still potent as she made her way into Mexico; Laredo, some 75 miles north of the center, recorded 8.28 inches.

While dumping 10 to 26 inches of rain on the Coastal Bend area, Fern caused the worst flooding in south Texas since hurricane Beulah in September 1967. Numerous towns were isolated, and many were flooded. The heavy rainfall sent floodwaters crashing over Wesley Seale Dam at Lake Corpus Christi, causing major flooding along the lower Nueces River. Considerable flooding also occurred on the Frio, Lavaca, Navidad, San Antonio, Guadalupe, Mission, and Aransas Rivers. Waters inundated most sections of Robstown, where a levee broke in two places. Water was 2 to 3 feet deep in some houses at Sinton. Some rural areas suffered the worst flooding of this century. In the Alice area, creeks reportedly rose to about the same height as during Beulah, but rose more rapidly and consequently caused more damage.

Five small tornadoes were observed during Hurricane Fern. Two occurred at Texas City on the 10th, one near Riveria on the 11th, one near Falfurrias on the 11th, and one near Orange Grove on the 12th. Total tornado damage was estimated at $18,000. There were no injuries. Six funnel clouds aloft were observed.

Property damage in Texas was estimated at $25.17 million, bringing the total storm damage to $30.23 million ($5.06 million crop damage). Hurricane Fern was directly responsible for two deaths in Texas. One swimmer drowned at the Corpus Christi City marina on the 11th, and another person drowned near Refugio on the 12th.

HURRICANE GINGER, SEPTEMBER 5-OCTOBER 5

At midday on September 10, the National Hurricane Center proclaimed that Tropical Storm Ginger had been born, some 275 miles south of Bermuda. At midday on October 5, a bulletin was issued that Ginger was dying some 420 miles northwest of the same island. These reports marked the beginning and the end of the longest-lived hurricane to ever roam the North Atlantic Ocean. It was probably the world's longest-lived tropical cyclone. For almost the entire month of September and into October, Ginger owned a large piece of the North Atlantic, threatening any trespassing ships with hurricane-force winds and dangerous seas.

Ginger, detected as a depression on the 5th near 25.5° N., 71.5° W., wound-up slowly and it wasn't until 1200 on the 10th that she reached tropical storm strength. However, the next day near 27.9° N., 63.3° W., Ginger was a hurricane. Her well-defined eye had a 991-millibar pressure at this time. She continued on an east-northeasterly heading at about a 10-knot speed. On the 12th, the ship ADONIS was whipped by 50-knot winds some 100 miles south of the storm's center. Winds near the center were about 75 knots. On the 13th, Ginger continued to grow and intensify as her 959-millibar center turned eastward; this was the lowest pressure in Ginger's long life. Maximum sustained winds were up to 90 knots. Suddenly, Ginger slowed and reversed her field. By the 14th, she was moving westward. While her intensity abated somewhat, Ginger remained big and strong as she meandered westward. On the 15th, the VICTORIA encountered 75-knot winds about 50 miles east of Ginger's center. Winds of 70 knots or more buffeted the ship for 6 hours. On the 16th, 45-knot winds lashed the ATHELDUKE some 90 miles north of Ginger's center and the DALILA some 100 miles to the west.

Ginger's central pressure continued to rise on the 17th and 18th as she turned southeastward. On the 19th and 20th, she completed a counterclockwise loop near 32° N., 52° W. After these acrobatics, the hurricane began a definite westward trek. On the 22d, Ginger crossed her path of 10 days before. At this time, her rising central pressure topped out at 995 millibars, and Ginger was a large loosely organized storm with gales out to 200 miles. On the night of the 22d, gales and heavy surf began to pound Bermuda. Early the next day, Ginger slipped by Bermuda about 100 miles to the south. Ginger's large circulation was also creating heavy surf along the north coast of Puerto Rico, Hispaniola, the Bahamas, and along the southeast coast of the United States.

Ginger slowed again and turned southward by the night of the 24th. At the same time, her central pressure began to fall. On the 25th, the BORNHEIM battled 50-knot winds, 150 miles northwest of the deepening pressure center. Winds rose to 75 knots near the center as swells continued to fan out and pound distant coastal areas. On the 26th and 27th, the ORE-SATURN and URSHALIM both within 60 miles of Ginger's eye encountered 50- to 60-knot winds. During this period, the storm underwent another change in direction as she swung around toward the northwest. On the afternoon of the 27th, Ginger's central pressure dropped to a secondary minimum of 969 millibars. Maximum sustained winds were near 85 knots. Early on the 25th, the empty 11,007-ton tanker PLAGIOLA on a run from Portland, Maine, to Curacao encountered 45-knot easterly winds some 180 miles northeast of the storm's center. The PITTSBURGH encountered 60-knot winds on the 14th, as did ORE-SATURN on the 26th. Winds of 50 knots were encountered by the MOSTANGER on the 17th and the EDWARD L. STEIMER on the 27th.

Ginger accelerated on the 29th, but then slowed the following day as she approached the North Carolina coast. She came ashore near Morehead City late on the 30th; this was close to where Tropical Storm Doria had moved inland just 1 month before. Once inland, the large storm weakened rapidly. It was just a dissipating depression by October 1. On the 2d, the weakening storm moved northward into southern Virginia, then turned eastward and moved back out into the North Atlantic near the mouth of the Chesapeake Bay. On the 5th, the remnants of Ginger were seen at 36° N., 70° W., heading east-southeastward.

As Ginger moved toward the North Carolina coast, wind gusts up to 80 knots were reported at Atlantic Beach. Gusts from 35 to 65 knots were common along the Outer Banks and the shores of Pamlico Sound. Maximum sustained winds were less than 45 knots over eastern

North Carolina and southern Virginia. Ocean tides ran 2 to 4 feet above normal from Norfolk to Morehead City. Tides on Pamlico Sound and its estuaries ran 4 to 7 feet above normal. At Washington, Aurora, New Bern, and Cherry Point, tides were all 6 feet or more above normal.

Rain was heaviest along the shores of Pamlico Sound, where 10 to 13 inches doused several east-central North Carolina counties. It was here that crops suffered heavily. Thousands of acres of corn and soybeans were seriously affected; damage was estimated at $10 million. This was the greatest economic impact of any hurricane on North Carolina since Donna in September 1960. Rainfall totals of greater than 10 inches were reported at Bayboro, Belhaven, Aurora, and on Roanoke Island. Property damage was minor in most areas. In areas of flooding, it was termed light to moderate.

Rainfall was moderate in southern Virginia. Norfolk reported a storm total of 7.61 inches between September 30 and October 3. Totals throughout the southeastern part of the State generally exceeded 2 inches, and many exceeded 5 inches. Along the Maryland-Delaware eastern shore, rainfall totals of 0.5 inch to 2 inches were common. A maximum sustained wind of 24 knots was reported at the Indian River Coast Guard Station.

No deaths or injuries were reported anywhere, and there were no tornadoes associated with Ginger.

TROPICAL STORM HEIDI, SEPTEMBER 10-14

Tropical Storm Heidi developed from the fifth tropical depression spawned by a persistent trough of low pressure which hung over the southwestern Atlantic for nearly 2 weeks. Although Heidi had a warm core, she never acquired all the characteristics of storms born deep in the Tropics. As a depression, she was first positioned 250 miles east of Great Abaco Island, in the Bahamas, on the 11th. She reached tropical storm strength on the 12th before crossing the 30th parallel on a meandering northward track. Late the following day, Heidi reached her full potential when winds near her 996-millibar center rose to 50 knots. A few hours later, the SUSANNE FRITZEN got caught in 35-knot winds 130 miles east of Heidi's center. Heidi maintained tropical storm intensity as she passed 60 miles east of Cape Cod at 1200 on the 14th. However, when she crossed the Maine coast a few hours later, winds were less than gale force.

Heidi turned extratropical around 0000 on the 15th; she washed out between the northern tip of Maine and the mouth of the St. Lawrence River less than 24 hours later.

HURRICANE IRENE, SEPTEMBER 11-20

Irene was the third African disturbance of the season to reach tropical storm intensity in the Caribbean Sea. The disturbance moved off the African coast on the 7th as evidenced by satellite pictures and the upper air soundings at Dakar. Traveling westward at 18 knots along the southern periphery of the subtropical anticyclone, the disturbance began to decelerate and turn to the west-northwest on the 10th. During this period, ATS-3 satellite movie loops and ship reports gave some evidence of a circulation.

Air Force reconnaissance reports on the 11th gave proof that a weak surface depression existed about 800 miles east of the Windward Islands.

The depression turned westward, then southwestward, and slowed considerably while moving through the Grenadine Islands. Beginning on the 15th, it gradually accelerated while following a track paralleling the South American coast roughly 75 miles offshore. The center moved across Curacao, Netherland Antilles, early on the 16th, and later in the day passed just off the tip of the Peninsula of Guajira in Colombia. During this period, the central pressure remained at 1008 millibars with a broad calm center and maximum sustained winds of 30 to 35 knots well to the northeast of the center. The maximum sustained winds reported were 23 knots at Aruba, Netherland Antilles, and 25 knots with gusts to 37 knots at Barbados. The greatest 24-hour rainfall was 3.35 inches at Trinidad.

The depression moved into the western Caribbean Sea traveling at 13 knots. Moving away from the South American land mass, Irene made another gradual turn to the west-southwest and slowly strengthened. On the morning of the 17th, a Navy reconnaissance plane reported a minimum pressure of 1005 millibars and sustained winds of 45 knots. At this time, tropical storm Irene was named while located about 350 miles east of San Andres.

Irene gradually strengthened during the next 36 hours. Air Force reconnaissance reported the lowest central pressure of 989 millibars and maximum sustained winds of 60 knots. The ATS-3 movie loop for the 18th showed the development of an eye and spiral bands emanating from the Pacific Ocean across the Isthmus of Panama and into the deepening Irene. Based on the above information, Irene was upgraded to a hurricane on the evening of the 18th. Navy reconnaissance reports showed little change in intensity as the center made landfall about 40 miles south of Bluefields, Nicaragua, early on the 19th. Heavy rains affected a large area from Honduras to Panama on the basis of an unusually large rain area to the north and east of the center.

Gale-force winds occurred all day on the 18th at San Andres with maximum winds reaching 40 knots. Bluefields reported 40 knots on the 19th.

No reports of death or damage have been received thus far from the area of strongest winds, but a Navy reconnaissance plane reported visible damage along the sparsely settled coastline and observed the center of Irene over the eastern edge of Lake Nicaragua. By the morning of the 20th, the center had emerged into the Pacific Ocean and was renamed Tropical Storm Olivia. This is the first known Atlantic hurricane to cross into the Pacific with almost immediate regeneration to a tropical storm.

TROPICAL STORM JANICE, SEPTEMBER 21-24

Tropical Storm Janice was first observed as a disturbance moving off the African coast by the ATS-3 satellite on the 16th. The disturbance moved westward at 15 knots and became a tropical depression on the 21st. Aircraft reconnaissance located the depression center, with highest winds of 30 knots some 1,000 miles east of Barbados that evening.

During the 22d, reconnaissance aircraft indicated an increase to storm strength. The wind field was not well organized with maximum sustained winds of 50 to 55 knots well to the north and east of a large area of light winds. The pressure minimum of 1005 millibars in

this light wind area was the lowest reported in Janice at any time. Janice continued west-northwestward at 15 knots and began to weaken on the 23d, finally being reduced to a tropical depression early on the 24th.

The large outflow pattern associated with Hurricane Ginger to the northwest led to 20-knot northwesterly winds over the top of Janice. These winds separated the lower level circulation of Janice from the convective mass of the storm and weakened her in an area normally favorable for intensification.

Depression Janice took a gradual turn to the northwest as it approached the trough extending southward from Hurricane Ginger, located southeast of Bermuda. Reconnaissance aircraft were unable to locate a circulation by the afternoon of the 24th. Thereafter, the remnants of the depression moved north-northwestward as an elongated cloud mass and became absorbed in the circulation around Ginger.

Although the system passed northeast of the Caribbean, a few heavy showers occurred in the Leeward Islands during the late afternoon and evening of the 24th. St. Kitts with a rainfall amount of 4.10 inches, most of which fell in a thunderstorm during the late evening, was the only station to report a large amount. There were no reports of damage in the Leeward Islands.

TROPICAL STORM KRISTY, OCTOBER 17-21

At 0000 on the 18th, a tropical depression formed from a cloud mass some 500 miles northeast of Puerto Rico. Later that day, a reconnaissance flight found a closed circulation with a central pressure of 1009 millibars. The storm was moving north-northeastward at 10 knots. Again the following day, a 1009-millibar pressure was found and winds were measured at 30 knots. Early in the evening of the 19th, Kristy reached tropical storm intensity.

On the 20th, Kristy passed very close to Ocean Station Vessel "E" where pressure dropped to 996.5 millibars and maximum sustained winds reached 40 knots. Later in the day, the British ship POTOSI reported 55-knot winds and a pressure of 992.4 millibars far south of the storm's center. At this time, Kristy was moving at a forward speed of 30 knots. Even as Kristy was named, a rapidly moving cold front sweeping over the North Atlantic began to bring colder, drier air into the storm's circulation. The remnants of Kristy passed through the northern Azores on the morning of the 21st.

TROPICAL STORM LAURA, NOVEMBER 12-22

A tropical depression was spawned along the southern edge of a large cloud mass which had spread northward from Panama. From the 12th through the 14th, the depression moved northwestward and intensified; on the 14th, Tropical Storm Laura was christened. The next day Laura shifted to a northerly track. However, on the 16th, the storm slowed and gradually reversed her field. She came close to western Cuba, but her eye did not cross the coast. On the 17th, Laura completed a loop. It was about this time that she reached her peak when maximum winds were estimated at 60 knots and central pressure was measured at 994 millibars. During this loop, heavy rains extended 150 miles east and north of Laura's center. She doused the Isle of Pines with about 20 inches of rain.

Following her loop, Laura drifted westward for more than 24 hours before turning southward on the 19th and southwestward on the 20th. She had weakened on her westward drift but regained some strength in the southwestern Gulf of Honduras on the 21st just before moving inland near Punta Gorda, British Honduras. Once ashore, Laura broke up over the mountains of Guatemala.

ACKNOWLEDGEMENTS

This report was made possible by information furnished by the National Hurricane Center, Miami, Fla., and by the Climatologists for Texas, Louisiana, Mississippi, Alabama, Georgia, South Carolina, North Carolina, Virginia, Maryland-Delaware, New Jersey, Pennsylvania, New York, and New England. If the reader desires additional synoptic details on these storms, he should refer to the appropriate issue of the Monthly Weather Review containing the seasonal summary prepared by the National Hurricane Center.

**The Environmental Data Service has for some time recognized that, without detailed expert appraisal of damage, all figures published are merely approximations. Since errors in dollar estimates vary in proportion of the total damage, storms are placed in categories varying from 1 to 9 as follows:

1 Less than $50
2 $50 to $500
3 $500 to $5,000
4 $5,000 to $50,000
5 $50,000 to $500,000
6 $500,000 to $5 Million
7 $5 Million to $50 Million
8 $50 Million to $500 Million
9 $500 Million to $5 Billion

*Including hurricanes

+ Additional deaths for which figures are not available.

Tracks of North Atlantic tropical cyclones, 1971

TROPICAL CYCLONES IN THE EASTERN NORTH PACIFIC, 1971

William J. Denney
National Weather Service, NOAA
Redwood City, Calif.

The disturbance which developed into Hurricane Agatha appeared on May 21, opening the hurricane season in the San Francisco area of responsibility--east of 140° W. The season ended November 28, as the remains of minor Tropical Storm Sharon dissipated. Advisories, issued at 6-hr. intervals, ascribed hurricane intensity in 125 instances and tropical storm intensity in 185. Bulletins, ascribing depression intensity, numbered 89. Scheduled release time for advisories and bulletins were 0300, 0900, 1500, and 2100 G.m.t. The advisories and bulletins were broadcast on regular schedule by several CW marine radio stations and a voice recording by the forecaster over marine radio station KMI. Radio ham, Julio Erenata, of San Diego relayed advisories of special interest in Mexico to a Mexican Emergency Warning Net operated by radio amateurs, as he has for the past several years.

TWELVE HURRICANES, A NEW RECORD

Twelve cyclones were judged in postseason analysis to have attained hurricane intensity, and six others are considered to have had maximum intensity as tropical storms. The average number of hurricanes and tropical storms per year, as recorded during the preceding 5 years, was 15.4 tropical storms, including 5.4 hurricanes. No more than seven hurricanes are on record for years prior to 1971, though presumably in pre-satellite days many that occurred escaped detection. Hurricane days totaled 48, and tropical storm days 47, counting 2 days for a day with two storms. Five of the hurricanes had winds of 100 knots or more, and some of the others may have had. Carlotta was handled on advisories as no more than a 60-kt. tropical storm but was reclassified to a hurricane after a postseason review of information from U. S. Air Force (USAF) reconnaissance on July 3 and 4. The seasonal distribution of tropical cyclones by month of beginning is shown in table 1.

The 1971 count of 12 hurricanes and six tropical storms makes a combined average of 15.8 per year (table 2) for the 6 years of full operational satellite coverage. It makes an average of 6.5 hurricanes per year (table 3) for the same period beginning in 1966.

It can be seen from the track charts (figs. 5-6) that the heavily traveled shipping lanes off the coast of Mexico and Central America were affected by storm and hurricane activity on many days of the season. Most ships plying those lanes managed to avoid dangerous and damaging winds and seas. However, several ships were caught up in the hurricane-force winds of Lily on August 31, when the hurricane turned toward the Mexican coast sooner than expected. Hurricane force winds were also reported by one ship each in Agatha, Bridget, Olivia, and Tropical Storm Katrina. The one report in Katrina told of a severe tropical line squall with force 12 winds; it was judged to have been a short-duration wind.

Twelve fatalities in Mexico were charged to Lily. The heavy damage caused by Agatha near Playa Azul, Bridget at Acapulco, and Katrina in the Los Mochis area is detailed in summaries of the individual cyclones.

BASIC INFORMATION

Satellite pictures and ship reports in combination provided most of the clues as to the beginning of storm development. With few exceptions, the USAF 9th Weather Reconnaissance Wing provided daily reconnaissance on tropical storms and hurricanes, and on areas where there was a good reason to suspect storm development. When a reconnaissance report was available, usually for a 2100 advisory, it was ordinarily the basis for the stated position and intensity of the storm or hurricane.

Twice daily fixes were usually provided on storms within 200 miles of Baja California, done by one flight with 3 to 5 hours between fixes. Most of the flights were in WC-135 aircraft, because of the need for long-range capability from the home base at Sacramento, Calif., or a need to stop overnight and refuel WC-130 aircraft. Some flights were made in WC-130's by the 55th Weather Reconnaissance Squadron, and a few of those went into Acapulco overnight. Other WC-130 flights were made from Panama by Atlantic Hurricane Hunters; that was when Olivia and Priscilla were near the Central American Coast southeast of Acapulco.

Flights in the WC-130's regularly penetrated all storms and hurricanes at 9,000 to 10,000 feet, making frequent measurements of wind and temperature. Most WC-135 flights were able to penetrate to the eye near their 30,000-ft. flight level, despite quite limited tolerance for turbulence. Many of the WC-135 flights descended in the storm center in order to gather more information when conditions permitted. A few found unbroken wall clouds too high for safe penetration by their aircraft, and could furnish only radar and visual information from the outside.

Satellite pictures were available for direct reception at San Francisco from ESSA 8, ITOS 1, and NOAA 1 at the beginning of the season, but only from ESSA 8 after Hurricane Bridget. NOAA 1 nighttime infrared pictures were the basis for upgrading Bridget to hurricane, but were not available later in the season. The National Environmental Satellite Service regularly provided timely information from ESSA 9 pictures and from ATS 1 and ATS 3 time-lapse motion pictures. ATS 3 was nonfunctional for a few weeks at the peak of the hurricane season, but during other parts of the season it did provide the first information of the day several times. ESSA 8 and 9, in polar orbit, provided pictures in midforenoon and early afternoon (local time), respectively. ATS 3 was stationary relative to the earth 22,000 miles above equatorial South America, and ATS 1 was geostationary at the same altitude over Christmas Island. Time-lapse motion pictures from ATS 3 were usually made starting shortly after sunrise on the hurricane, and those from ATS 1 were made in the afternoon.

Some of the more important ship reports are mentioned in the summaries of individual tropical cyclones which follow. Their tracks are shown in figures 5-6, and cyclone highlights are summarized in table 4. All times are G.m.t. unless otherwise stated.

HURRICANE AGATHA, MAY 21 TO 24

Agatha, the first hurricane of the season, developed rapidly beginning May 21. Evidence of increasing winds around a new low-pressure center was first apparent 250 miles south-southeast of Salina Cruz as seen on time-lapse motion pictures made by the National Environmental Satellite Service shortly before 1800. Tropical storm intensity was reached a few hours later.

Two ships, the steamers GERDT OLDENDORFF and PRESIDENT MADISON, encountered 50-kt. winds at 0600 the next day near the storm center, 190 miles south-southwest of Salina Cruz. Seas had increased to 13 feet by that time, as observed from the PRESIDENT MADISON. (See the "Letter to the Editor" column on page 212 of the July 1971 issue of the Mariners Weather Log for more details on the PRESIDENT MADISON's encounter with Agatha.)

The new storm moved west-northwestward at 10 knots parallel to the coast for about 24 hours, while strengthening to a hurricane. Hurricane Agatha turned north-northwest toward the coast early on the 23d, passing 100 miles southwest of Acapulco with its forward speed decreasing to 5 knots. The HISPANIOLA had 60-kt. northerly winds, and the TORENIA had 85-kt. easterly winds, as the small vicious hurricane was shown by the TORENIA's radar around an eye at 17° 10' N., 102° 00' W., at 1200 on the 24th. The hurricane continued on the north-northwesterly course and regained 10 knots of forward speed as it moved onto the Mexican mainland 80 miles northwest of Zihuatanejo about noon (local time) of the 24th. Half of the homes in the village of Playa Azul were destroyed, and the entire banana harvest, 60 percent of the mango crop, and 15 percent of the coconut crop were lost.

HURRICANE BRIDGET, JUNE 14 TO 20

Hurricane Bridget developed during a 48-hr. period beginning on June 14 from a collection of heavy showers that had persisted west of Costa Rica and Nicaragua for a few days. The developing storm system began to move at about 10 knots on a west-northwesterly track from a point near 11° N., 91° W., on the 14th. The initial depression strengthened to a tropical storm by 0000 on the 15th, as revealed by a report from the RITA MAERSK. Bridget became a hurricane about 30 hours later, as estimated from a nighttime infrared picture made by the NOAA 1 satellite. The hurricane moved toward the west-northwest, edging slightly toward the coast as its forward speed increased to 14 knots during the day of the 16th. The Liberian tanker ADAMANTIA felt the full-hurricane fury of 75-kt. winds while between the hurricane center and the coast at 1800 on the 16th. At this time, Bridget's maximum winds were estimated at 85 knots.

The eye of the hurricane passed an estimated 30 miles offshore from Acapulco about 0200 on the 17th. Wind gusts as strong as 90 knots were measured at Acapulco International Airport, adjacent to the ocean southeast of the city. Damage from the hurricane winds and torrential rains was officially estimated at $40 million. Twenty boats, plus the flagship of the Admiral of the Mexican Navy, were sunk in the Bay. Many house roofs, outdoor advertising signs, and windows were lost.

The eye of Bridget remained 30 miles or more offshore through 1200 of the 17th, and continued up the coast with a forward speed of about 16 knots. It then moved onto land about 85 miles southeast of Manzanillo shortly before 1800. The hurricane winds were tamed abruptly by friction over the rugged Mexican terrain. A residual low-pressure center, with winds less than 20 knots, moved westward over water from near Manzanillo shortly before 0600 on the 18th. It was followed on satellite pictures until it dissipated 200 miles south of Cape San Lucas around 0000 on the 20th.

HURRICANE CARLOTTA, JULY 1 TO 8

The SHEAF TYNE provided early information on the disturbance that developed into Hurricane Carlotta. Weather reports from the vessel at 0000 and 0600 on July 1 revealed that a weak 1008-mb. low pressure center had formed in a showery area centered about 100 miles east of Clipperton Island. Winds encountered by the ship, which passed near the incipient storm center, were only 15 knots. The weak LOW became a tropical storm during a 24- to 30-hr. period, while moving westward at 8 knots. The intensifying new storm was centered near 11° N., 112° W., and was turning toward the northwest by 1800 on the 2d. Movement was toward the northwest at 11 knots through the 4th.

Carlotta was never called more than a tropical storm in operational advisories. A postseason review of USAF reconnaissance reports and satellite pictures for July 3 and 4 led to the conclusion that hurricane intensity prevailed for nearly 24 hours. The reconnaissance found a closed circular eye 15 miles in diameter on the 3d, measured eye pressure at 980 mb., and saw winds as strong as 60 knots on a partially observed sea surface on the 4th.

Carlotta began to weaken on the 4th, turned toward the west-northwest, and accelerated. Winds were no stronger than 45 knots on the 5th; they were an estimated 30 knots on the 6th when Carlotta was downgraded to a depression near 18° N., 126° W.

HURRICANE DENISE, JULY 2 TO 13

Denise, one of the stronger east Pacific hurricanes of recent years, began to develop on July 2 in an area of showers centered around 11.0° N., 99.5° W. A low-pressure circulation, with winds as strong as 25 knots and a minimum pressure of about 1009 mb., was present near 12° N., 103° W., the next day. Tropical storm intensity, with winds to about 45 knots around a center at 14° N., 108° W., was estimated from an ESSA 8 satellite picture made at 1737 on the 4th. The new storm then intensified steadily for the next 4 days while moving toward the west. Her speed was initially 10 knots, but she speeded up to 16 knots on the 7th. Hurricane intensity was attained on the 6th, apparently a few hours after the ROBIN HOOD passed near the center reporting a northerly wind of 36 knots and a 999.5-mb. pressure at 0600 (see page 288 of the September 1971 issue of the Mariners Weather Log). Winds as strong as 110 knots were seen on the partially observed sea surface around the eye of Denise, upon penetration by USAF weather reconnaissance on the 8th. Near 9,000 feet, flight-level winds were measured as strong as 118 knots and the eye pressure was 951 mb., suggesting maximum surface winds of about 125 knots.

The strong hurricane then turned gradually toward the west-northwest, with a forward speed of 15 knots and little change in intensity for the next 2 days. Denise then began to weaken late on the 10th, after a fix at 15° N., 139° W., at 1800, and turned toward the west. She was only a 40-kt. tropical storm when 300 miles southeast of Hilo, Hawaii, on the 12th. Denise dissipated to a 20-kt. depression upon passing 150 miles south of the Big Island the next day.

TROPICAL STORM ELEANOR, JULY 6 TO 11

A weak low-pressure center appeared near 12° N., 106° W., at about 1800 on July 6. It then moved slowly westward and evolved to Tropical Storm Eleanor near 13° N., 115° W., by 1800 on the 8th, as seen on an ESSA 8 satellite picture. Eleanor strengthened to an estimated 50-kt. storm during the following 24 hours, while moving toward the west at 16 knots. Eleanor

then began to slow down and weaken. She turned toward the west-southwest from 15° N., 127° W., at about 1800 on the 10th, and was a dissipating depression centered near 13° N., 133° W., 24 hours later.

HURRICANE FRANCENE, JULY 17 TO 23

An incipient low-pressure circulation with showers appeared near 12° N., 104° W., on July 17. Depression bulletins were begun the next day from a satellite picture, placing the 1800 position near 12° N., 108° W. Francene was named as a new tropical storm 6 hours later when the British ship PELEUS encountered 35-kt. west-southwesterly winds about 50 miles south-southwest of the center.

The new storm moved toward the west-northwest at 14 knots for the first 24 hours, while intensifying to a hurricane. It then slowed down, promptly began to weaken, and was no longer a hurricane when studied by USAF weather reconnaissance at 1800 on the 20th. Tropical storm Francene then moved westward at 9 to 12 knots through the 22d. The storm continued to weaken, and crossed the 125th meridian near 16.5° N. at about 1200 on the 22d. The remains of the weakening storm crossed about 110 miles ahead of the ship FORELAND on the 23d, with no noticeable effects at the ship, as related in a 2200 radio message from 16° N., 129° W. Francene had then dissipated, for practical purposes.

TROPICAL STORM GEORGETTE, JULY 20 TO 27

Showers grouped around the point 14° N., 112° W., could be seen to be organizing into a tropical depression from satellite pictures of July 22. USAF weather reconnaissance investigated at 1800 the next day and found new Tropical Storm Georgette with winds as strong as 45 knots around a center at 16.3° N., 115.6° W. Georgette was a 50-kt. maximum windstorm for most of the next 3 days, moving northwestward at 6 knots for 24 hours before speeding up to 9 knots. She turned west-northwestward on the 25th and began to weaken, although her forward speed continued to increase. Maximum winds were 45 knots as found by USAF reconnaissance in fixing the center at 21.4° N., 126.2° W., at 1800 on the 26th, but the storm's cloud system had begun to evaporate. The remains of the storm had diminished to a harmless and rapidly dissipating depression some 300 miles farther west the next day.

HURRICANE HILARY, JULY 26 TO AUGUST 7

Hilary developed rapidly in the vicinity of Clipperton Island on July 26. An ESSA 8 picture revealed the incipient hurricane center near 10° N., 111° W., at 1800. Winds had increased to 55 knots when USAF weather reconnaissance fixed the center at 11.3° N., 114.0° W., 24 hours later. A full hurricane with maximum winds of about 80 knots was found by the reconnaissance flight of the 28th, and winds of at least 65 knots were reported by daily flights through August 2. Movement was toward the west-northwest at about 6 knots through July 30. Then there was a turn toward the west-southwest lasting about 24 hours. Hurricane Hilary turned abruptly toward the northwest on August 1, crossing the 15th parallel toward colder water near 124° W. Weakening then began, and maximum winds had decreased to 40 knots as the storm was crossing the 135th meridian near 19° N. on the 4th. The dissipating storm was then moving westward at about 8 knots. Final dissipation was completed west of 140° W., by early on the 7th.

There were no reports from ships telling of encounters with strong winds from Hurricane Hilary, even though she was a full hurricane for nearly a week. However, the British ore carrier CHIYODA reported swells higher than 20 feet for more than 36 hours, while overtaking and passing the hurricane about 200 miles north of the center between July 29 and the 30th.

HURRICANE ILSA, JULY 30 TO AUGUST 8

Ilsa, the seventh tropical storm and the fifth hurricane to start in the eastern North Pacific during July, was first seen on ESSA 8 satellite pictures as a disturbance near 12.0° N., 97.5° W., on July 30. It became a rapidly strengthening depression the next day near 12.5° N., 101.0° W., and was a hurricane near 13.5° N., 104.0° W., at 0600 on August 1.

The ship IRISH ELM was caught up in the rapidly developing and large hurricane. At 0300 on the 1st, the ship was moving westward at 20 knots about 90 miles north of the center. Winds were only 20 knots, and pressure 1005.5 mb. Three hours later, the easterly winds had picked up to 50 knots, and they were up to 60 knots at 0900. The ship turned toward the north at about 0600 to struggle out of the hurricane, which was moving toward the west-northwest at 15 knots, but winds of 50 knots or stronger were encountered until after 1800. The reports from the IRISH ELM were a principal basis for upgrading Ilsa to a hurricane.

The size of Ilsa was illustrated at 0000 on the 2d when the ESSO WASHINGTON battled 40-kt. east-southeasterly gales and 30-ft. seas and swells nearly 200 miles north of the center. Ilsa continued to strengthen through the 2d but then began to weaken. USAF weather reconnaissance went into the hurricane eye at 2223 on the 3d, locating it at 18° 32' N., 112° 04' W., seeing winds as strong as 65 knots on a partially observed sea surface, and reporting other information indicating maximum winds in the 70- to 75-kt. range. Figure 8 shows Ilsa off the Mexican west coast late the next day.

The hurricane turned from its slow northwestward movement to a faster west-northwesterly course early on the 5th and had diminished to a 55-kt. tropical storm by 1800. Dissipation to a depression was abrupt during the following 24 hours. No low-pressure circulation could be detected by USAF weather reconnaissance investigating the residual cloud mass near 22.7° N., 122.0° W., at 1800 on the 6th.

TROPICAL STORM JEWEL, AUGUST 6 TO 11

The early stages of Tropical Storm Jewel first came to attention through reports from the PRESIDENT JACKSON. The ship had 20-kt. southeasterly winds near 15.5° N., 95.5° W., at 1800 on August 5; 6 hours later, winds had increased to 30 knots from the east-southeast as the ship moved 160 miles to the west-northwest. The ship AURALIS revealed tropical storm intensity at 1800 on the 7th, in telling of easterly winds of force 7 to 8, a very rough sea, falling barometer, and heavy rain squalls. A concurrent ESSA 8 satellite picture indicated the new storm center to be near 15.5° N., 102.0° W. USAF weather reconnaissance found the storm centered at 16° 10' N., 106° 15' W., and rather poorly organized at 2045 on the 7th. The mini-

mum pressure in the eye was 1000 mb. The area affected was large, however. The OCEAN PRIMA had 45-kt. winds some 190 miles northeast of the center and 50 miles off the Mexican coast. Jewel was still a large loosely organized storm on the 8th, although her central pressure was down to 993 mb. By the next day, the central pressure had risen to 1002 mb. and weakening had begun. Winds in the weak tropical storm range were still apparently present in squally areas in the outer part of the storm until early on the 10th. Dissipation of the residual cloud system could be followed on satellite pictures through August 11.

TROPICAL STORM KATRINA, AUGUST 8 TO 12

Katrina was a very small storm which developed in the southeastern fringe of the large low-pressure circulation around Tropical Storm Jewel. Because of her small size and the prevalence of numerous thunderstorms which could have had strong winds, it is not possible to establish with assurance a time and place of her initial development.

It is thought that the OCEAN PRIMA had an encounter with Katrina on August 8 at 1800, shortly after she developed. At that time, the ship reported 35-kt. south-southeasterly winds and a 4-mb. pressure rise in 3 hours, while moving southeastward at 20 knots to 14.5° N., 97.4° W. About 24 hours later, the ESSA 8 picture showed a small oval cloud mass which might have been Katrina near 15° N., 102° W.

The NEGO ENTERPRISE at 0542 on the 10th sent a message which was the basis for warnings of dangerous weather, and which apparently told of an encounter with Katrina: "WARNING ELFW IN POSITION 16° 40' N., 103° 00' W. OFF CAPE TELMO COURSE 115 PASSED THROUGH SEVERE TROPICAL LINE SQUALL AT 0400 GMT WITH HURRICANE FORCE TWELVE WINDS AND ZERO VISIBILITY AT FRONT PASSING NE TO SW AND MOVING NW DIRECTION." A picture from ESSA 8 about 12 hours later revealed extensive heavy cloudiness in the area, with a possible small tropical storm embedded in the cloud mass near 18.5° N., 106.0° W. The cloud mass was confirmed as being a tropical storm by a 2100 report from the CAP COLVILLE at 20.1° N., 106.6° W. It told of estimated 40-kt. east-southeasterly winds with a pressure of 1010 mb., and falling 5 mb./3 hours, as the ship moved southeastward at 15 knots fighting seas higher than 20 feet. The POLARLICHT reported 3 hours later, and 24 miles to the west, telling of southerly winds of 52 knots along with a pressure of 1007.5 mb., which was beginning to rise, as the ship moved southeastward at 15 knots.

Katrina moved north-northwestward from there, passing through the Gulf of California about halfway between La Paz and Mazatlan. Her strong winds died down before she moved onto the Mexican mainland near Los Mochis the night of the 11th-12th. Up to 9 inches of rain fell in the Los Mochis area as the storm was moving in, and there were heavy showers on and off through the next 5 days. Resultant floods washed out sections of roads and railroads, and destroyed 20 homes, three bridges, and a railroad trestle. Seventy other homes and five bridges were damaged, and crops were ruined.

HURRICANE LILY, AUGUST 28 TO 31

A collection of heavy showers which were over the Gulf of Tehuantepec on August 27 organized around a loose low-pressure center by early the next day. The depression was near 14° N., 96° W., at 1800 on the 28th, as seen on a picture from the ESSA 8 satellite. The depression intensified to a tropical storm during the following 24 hours, while moving west-northwestward at 11 knots.

New Tropical Storm Lily then turned gradually toward the Mexican coast, while slowing down and strengthening to a hurricane. She was moving northwestward at 5 knots as a young hurricane late on the 30th, but turned north-northwestward and speeded up during the night.

The center of Lily moved inland 30 miles northwest of Manzanillo about 0800 (local time) on the 31st. Wind gusts were estimated as strong as 90 knots, with sustained winds of 80 knots and seas as high as 30 feet at that time. Nine people drowned as a boat capsized off a beach between Manzanillo and Puerto Vallarta, and there were three other fatalities in Mexico because of the hurricane. Heavy rains fell over a large area from the coast inland to the plateau of central Mexico.

Several ships were caught up in the strong winds and rough seas. Some felt the full fury of hurricane-force winds and high seas. Among those were the TURRIALBA, the RICHARD, the JAG SHANTI, the SHINSEI MARU NO. 5, and the ITALIA. Extracts from the deck log and the Ship's Weather Observations of the TURRIALBA are reproduced on page 354 and 355 of the November 1971 issue of the Mariners Weather Log.

HURRICANE MONICA, AUGUST 28 TO SEPTEMBER 4

Hurricane Monica began to form on August 28 in a heavy shower area of the intertropical convergence zone about 100 miles north of Clipperton Island. An ESSA 8 satellite picture at 1730 on the 29th revealed a young tropical storm near 12° N., 112° W. Tropical storm Monica then moved northwestward at 5 to 8 knots for 2 days while strengthening to a hurricane. Hurricane Monica turned north-northeastward late on the 31st from 16° N., 115° W. She was described by USAF reconnaissance on September 1 as being among the strongest hurricanes they had observed in the eastern North Pacific. At that time, the hurricane center, containing 100-kt. plus winds, was located about 25 miles south-southeast of Clarion Island.

Monica then turned north-northwestward at 4 knots for about 24 hours and began to weaken. Maximum winds on the 2d diminished to 75 knots at 1624 and to 65 knots by 1955, as seen by USAF reconnaissance. The storm moved slowly northward and weakened rapidly after that. It was packing winds no stronger than 40 knots at 1600 on the 3d, and was practically dissipated with 25-kt. winds around a residual center at 23° N., 115° W., 24 hours later.

No ships reported being caught in the hurricane-force winds of Monica. The FORT SAINTE MARIE and the JAPAN PINE did encounter gale-force winds and rough seas in the southeast quadrant of the developing hurricane on the 31st. Both ships made a change of course from northwest to southwest to pass around the south side of the storm.

HURRICANE NANETTE, SEPTEMBER 2 TO 9

Nanette began to develop over the warm waters south of Tehuantepec, Mexico, on September 2. The PRESIDENT ARTHUR reported 20-kt. southeasterly winds and a 1009-mb. pressure 160 miles south-southeast of Salina

Cruz at 0000 on the 3d. Winds had held the same direction over the preceding 6 hours, while the ship was on a course toward the southeast. Information at that time was inadequate to fix an exact position of the developing low-pressure center, and it continued so for 36 hours.

An intensifying tropical storm was apparent from an 1800 report on the 4th from the MORNING LIGHT. That report told of easterly winds of 35 knots with a pressure of 1008 mb. at a point 50 miles south of Acapulco. The center of Nanette was then visible on an ESSA 8 satellite picture some 90 miles south of the ship. Nanette moved west-northwestward parallel to the coast at 9 knots for the next 24 hours and continued to intensify. The storm then turned toward the northwest at about the same speed and was soon a hurricane. The northwesterly track took the hurricane center to a point 50 miles southwest of Cape Corrientes late on the 6th. Maximum winds at that time were 80 knots, as determined by USAF reconnaissance. The PRESIDENT MADISON reported 50-kt. winds, 20-ft. waves, and 24-ft. swells on the 6th, about midway between the hurricane center and the coast.

The hurricane took a broad turn toward the west upon entering the mouth of the Gulf of California, and began to weaken. Nanette was reduced to a weakening tropical storm shortly after passing 75 miles south of Cape San Lucas at 1600 on the 7th. Weakening continued as the storm proceeded along its westerly track. Nanette was a dissipating depression 200 miles northwest of Clarion Island 2 days later.

HURRICANE OLIVIA, SEPTEMBER 20 TO 30

Hurricane Olivia was known as Hurricane Irene in the Caribbean and Nicaragua. Irene moved over southern Nicaragua from the Caribbean Sea on September 19, and weakened to a depression while crossing the relatively low terrain to Lake Nicaragua and the Pacific.

The depression promptly regenerated to 50-kt. Tropical Storm Olivia. Its center was about 50 miles west of Managua at 1516 on the 20th based on an ESSA 8 satellite picture. Olivia reached hurricane strength 24 hours later, while she moved to a position some 60 miles south of San Jose, Guatemala. The hurricane continued along a westerly track at 8 to 16 knots, pulling slowly away from the coast and strengthening steadily until the 25th. Olivia was a 100-kt. hurricane on the 25th. Its center passed 200 miles southwest of Manzanillo, turned toward the northwest, and threatened to turn northward into the mouth of the Gulf of California.

A change in atmospheric steering turned the hurricane back toward the west on the 26th, and 90-kt. winds were found around a center fixed by USAF reconnaissance 75 miles northeast of Socorro Island at 2200. The westward movement lasted only about 24 hours, and Olivia continued as a powerful hurricane. The influence of a middle latitude low-pressure trough on the hurricane steering again became effective late on the 27th, and the center made a broad turn toward the north from a point 100 miles northwest of Socorro Island.

Water temperatures west of Baja California were not warm enough to support a hurricane, so Olivia weakened rapidly. She was only a minor tropical storm when seen on ESSA 8 satellite pictures about 275 miles southwest of Magdalena Bay at 1811 on the 28th. The remains of the storm were centered 150 miles west of Magdalena Bay on a picture 24 hours later. Maximum winds were in the depression category. All indications of a low-pressure circulation had disappeared from the remaining cloud mass seen over Baja California, east of Punta Eugenia, on the satellite pictures of the 30th.

Ships were successful in circumnavigating Olivia most of the 10 days she was a tropical storm or hurricane. As the storm was reorganizing off Nicaragua on the 20th, the LETITIA LYKES had 35-kt. winds 100 miles southwest of the center. The unexpected turn toward the west on the 26th caught several ships in strong winds and rough seas. Among the less fortunate were the HORIZON and the KYOKEI MARU. The HORIZON near 18° N., 111° W. fought 50- to 70-kt. winds and 30- to 45-ft. waves for nearly 12 hours in passing southeastward around the west side of the hurricane on the 26th and 27th. The KYOKEI MARU near 19° N., 113° W., had 50- to 55-kt. winds, 10- to 16-ft. seas, and swells of at least 30 feet for several hours, while on a similar track around the west side of the hurricane on the 27th.

The British cruiser HMS BLAKE, enroute to San Francisco for "British Week" festivities, had the hurricane center on its radarscope for more than 8 hours on the 27th.

HURRICANE PRISCILLA, OCTOBER 6 TO 12

A minor disturbance that crossed the Isthmus of Panama on October 4 developed slowly during the following 2 days. It became a tropical depression, with sustained winds up to 30 knots, near 10.5° N., 90.0° W., at 1200 on the 6th.

The depression strengthened to 40-kt. Tropical Storm Priscilla by daybreak the next day, while moving west-northwestward at 8 knots. Winds of 35 to 40 knots and rough seas were encountered at 1500 about 100 miles from the center in the northeast quadrant by the IVAN TOPIC and the AMERICAN LARK.

The HAMMONIA was buffeted by 50-kt. winds on the north side of the intensifying Priscilla at 1200 on the 8th. USAF reconnaissance then found maximum winds to be 70 knots around a 40-mi.-diameter hurricane eye centered at 13.1° N., 96.8° W., at 1734 the same day.

The established movement parallel to the coast and toward the west-northwest at 8 knots continued, simplifying circumnavigation of the strengthening dangerous hurricane. Maximum winds as strong as 90 knots were estimated around a center at 14.6° N., 100.4° W., at 1800 on the 9th, based on a USAF reconnaissance report and an ESSA 8 satellite picture. The reconnaissance had found a central pressure of 960 mb., down 24 mb. in 24 hours.

Priscilla was at her maximum strength 24 hours later when the next USAF reconnaissance mission found surface winds as strong as 110 knots around an 18-mi.-diameter eye containing a central pressure of 951 mb.

The hurricane then began to weaken and turn slightly toward the coast. Maximum winds had diminished to 80 knots and central pressure had risen to 972 mb., when the Air Force made the 1800 fix on the 11th 140 miles south-southwest of Manzanillo. Priscilla weakened after that, following a track turning progressively toward the north and eventually northeast. The CALMAR was caught in 50-kt. winds and 16-ft. waves between the hurricane center and the coast at 0000 on the 12th. At the same hour, the FERNDALE fought 48-kt. winds 35 miles northwest of the CALMAR near 20° N., 106° W. Visibility was cut to 200 yards by heavy rain. A few hours afterward, Priscilla was centered about 40 miles west of Cape Corrientes and was turning toward the northeast. She moved onto the Mexican mainland near San Blas around daybreak of the 12th. At landfall strongest winds were thought to be about 50 knots.

TROPICAL STORM RAMONA, OCTOBER 28 TO 31

Ramona was first seen on an ESSA 8 satellite picture taken at 1703 on October 28. The storm had appeared overnight, since no evidence of storm development had been seen in the area on pictures of the preceding day. Strongest winds in the new storm were estimated to be at least 45 knots around a center near 11.3° N., 104.0° W., from its appearance in the picture.

About 24 hours later, USAF reconnaissance found no storm organization to the cloud system, and the clouds shown by the ESSA 8 picture of the 29th had little indication of a rotating storm. It was concluded that a weak storm had developed on the 28th but had weakened promptly to a depression.

The residual depression dumped heavy rain whipped by 25-kt. easterly winds at 15.0° N., 110.6° W., at 0900 on the 30th, as encountered by the GUAVACORE. It dissipated completely during the next 24 to 30 hours, while remaining in the same area.

TROPICAL STORM SHARON, NOVEMBER 25 TO 28

Weak late-season Tropical Storm Sharon began to develop on November 25. The beginnings of the storm were detected near 9.5° N., 100.5° W., on an ESSA 8 satellite picture made at 1551. A U. S. Navy ship reporting 50 to 75 miles on the northeast side of the low-pressure center 8 hours later told of 25-kt. easterly winds, a 1008.8 mb. pressure, 4.5-ft. seas, and an 8-ft. easterly swell. Strengthening was indicated by the ESSA 8 picture of the 26th. A report from USAF weather reconnaissance on the 27th together with the satellite pictures of the 26th and 27th gave reason to believe that a weak storm had been present at picture time on the 26th. Winds up to 30 knots were estimated by the reconnaissance of the 27th, and concurrent pictures indicated considerable weakening from the previous day. The weakening continued to complete dissipation on the 28th.

† Includes only tropical cyclones that have been named

* Origin is taken as the first apparent center of enhanced shower activity or low pressure, however slight.

‡ Maximum wind speed estimates are those arrived at in postseason study. USAF reconnaissance and shipboard wind measurements [illegible] than [illegible] any day.

^ Several of the cyclones are thought to have had pressures 10 mb or more lower than the lowest reported.

‡ A weak low-pressure center residual from the dissipated hurricane Bridget could be traced from Manzanillo to 20° N., 110° W.

TYPHOONS OF THE WESTERN NORTH PACIFIC, 1971

Capt. Charles R. Holliday, USAF
Joint Typhoon Warning Center, U. S. Fleet Weather Central
Guam, Mariana Islands

The 1971 typhoon season was the most active since 1967. A total of 35 tropical storms tracked the waters of the western North Pacific, commencing in January with Sarah and terminating with Judy in November. The 24 storms which generated to typhoon strength topped the climatological average by six and ranked 1971 along with 1962 for the second largest number of typhoons on record. Tables 1 and 2 contain the statistics on the storms for past years.

1971 was marked by two abnormally active periods. The usually quiet period of April and May, averaging less than two storms, exploded for a total of seven storms. On May 3-4 there were three tropical storms--Wanda, Amy, and Babe--in existence simultaneously. The month of July was recordbreaking with a total of eight storms, bettering the previous high of seven set in 1964.

Six typhoons reached the 130-kt. superstatus, which compares closely with the mean (1959-70) of 5.8. Irma was the most intense with sustained winds exceeding 150 knots, while Lucy, Nadine, and Wendy were the largest with their circulations dominating 600 miles or more of radius.

The most disastrous typhoon in 1971 was Rose which struck Hong Kong in August. Approximately 130 people were killed, 5,000 persons were left homeless, and 28 ocean-going vessels were run aground or sunk. Hester, which struck the Vietnam coast near Chu Lai in October, was probably the most destructive storm in terms of U. S. military damage during the entire war.

The 1971 typhoons are described in the following summary. Local time is used in each narrative. Tropical storm summaries can be found in the appropriate Smooth Log of the Mariners Weather Log. Damage and casualty statistics are given, when available.

Table 3 contains the vital statistics for all the 1971 storms. The storm tracks and maximum winds are based on poststorm analysis. Times in table 3 and in storm track charts are in G.m.t. Beginning and ending dates on the legend of the storm tracks and in table 3 correspond to the period when the storm possessed sustained winds of 34 knots or greater and was tropical in nature or in the process of losing its tropical characteristics, but not completely extratropical. The dates along each individual storm track correspond to dates on which bulletins or advisories were issued. These dates do not always agree with those in the legend.

VERA

Originating from a circulation situated in the central Carolines, Vera was destined to become the season's first typhoon. By April 12, while on a west-northwesterly heading at 8 knots in the Philippine Sea, reconnaissance aircraft reports indicated the system had developed to a tropical storm. Shortly after reaching typhoon intensity, by the early morning of the 14th, Vera began to slow in forward speed. Taking a temporary westerly excursion, the typhoon reached her peak intensity of 90 knots about 250 miles west of Escarpada Point on Luzon during the 15th. With an abrupt shift in course later in the day, the typhoon headed slowly northeastward and gradually diminished in intensity. On the 17th, Vera had accelerated in forward speed while paralleling the Ryukyu Island chain and weakened to tropical storm force. Encountering the westerlies, the storm shifted to a more easterly course on the 18th and became extratropical as she merged with a frontal zone south of Japan later that day.

WANDA

Wanda, followed by Amy and Babe, heralded the greatest outbreak of tropical storm activity in any spring on record. Developing to tropical storm force 150 miles east of Samar in the central Philippines, the storm tracked across the island near the Leyte Gulf with sustained winds of 50 to 60 knots. The coastal city of Tacloban registered a peak gust of 84 knots during passage. Wanda then passed over the Visayas and into the Sulu Sea, crossing Palawan Island the morning of April 26. The typhoon left 56 people dead in the Philippines with 39 reported missing. Damage to public and private property was estimated near $700,000 (U. S.).

Upon entering the South China Sea, Wanda slowed in forward speed to 3 to 4 knots for a 24-hr. period and weakened to a depression. At this point chances for her to regain strength were considered slight. Surprisingly, during the evening of the 29th, Wanda regained her tropical storm status. In the meantime, the storm had swung to a northwesterly course.

Continuing to intensify, typhoon force was attained less than 60 miles off the Vietnam coast southeast of Qui Nhon. Reaching a peak intensity of 75 knots, the typhoon paralleled the coastline for 30 hours on May 1-2, the eye barely touching ashore near Quang Ngai.

Wanda weakened to tropical storm force upon leaving the Vietnam coastline and struck Hainan Island on the 3d with winds of 45 knots. Emerging from Hainan 24 hours later as an extratropical system, the remains of Wanda drifted on an easterly course before finally collapsing in the northern South China Sea.

Typhoon Wanda was the first significant storm in more than 20 years to affect the coast of Vietnam during April or May. At Chu Lai AB maximum winds of 35 knots with gusts to 63 knots were reported. Landing Zone "English" sustained 50-kt. winds and gusts were estimated near 70 knots. A total rainfall of 7.5 inches and 8.25 inches was dumped on Landing Zone "English" and Duc Pho, respectively. Over 23 people were killed in the Quang Ngai Province, and over 10,000 homes and buildings were partly or completely destroyed.

AMY

As Wanda was targeting in on the Vietnam coast, a disturbance in the Truk-Ponape area of the central Carolines gave birth to Tropical Storm Amy on April 29. As Amy moved northwestward, she intensified quickly into a typhoon. By daybreak of May 1, the eye crossed Moen in the Truk Islands with the weather station reporting 65-kt. winds with peak gusts to 98 knots and a minimum pressure of 974.8 mbs. Amy continued to intensify as she crossed Namonuito Atoll, packing peak winds of 115 knots. She completely destroyed the weather station on the atoll.

There was 80 percent damage sustained in the Truk District with over 2,250 homes demolished. Thousands of persons were made homeless. A total of $4.5 million damage was sustained in the private and public sectors. One death and several injuries were reported. An additional $1 million was lost because of damage incurred by small businesses, crops, boats, equipment, etc. Hardest hit in the Truk District was Namonuito

Atoll. Inspection of damage at Namonuito depicted a scene as if the atoll had been struck by fire. Little foliage was left and bark was stripped from the few remaining trees.

By noon of the 2d, aircraft penetration revealed that Amy's central pressure had deepened explosively with a 51-mb. drop in 15 hours to 899 mbs., ranking Amy as the season's first supertyphoon. By that afternoon, maximum sustained winds of 150 knots were concentrated around a tight circular eye 10 miles in diameter. After passing within 84 miles of Guam, the typhoon began to slow and start a slow drift to the northwest about 120 miles west of Guam on the 3d. She then commenced to track northeastward at 11 knots, west of the Mariana Islands. Maximum winds had diminished slightly to 120 knots.

Highest winds reported on Guam were 51 knots with a gust to 68 knots at the Fleet Weather Central, while Anderson AFB on the northern end of the island sustained winds of 36 knots with gusts to 60 knots. The accompanying torrential rainfall totaled up to 15.26 inches at the National Weather Service during the passage of Amy. Damage on Guam amounted to over $900,000 in public and private property. In the northern Marianas, minor damage was sustained mostly to the copra and banana trees. The weather station on Pagan reported a maximum wind of 28 knots with gusts to 47 knots.

Amy continued on a northeasterly course, passing the northernmost island of the Marianas (Maug) on the evening of the 5th at a forward speed in excess of 20 knots. She kept a northeasterly heading through the 6th while weakening to minimal typhoon strength. By the 7th, Amy had decreased to tropical storm intensity and accelerated to more than 40 knots in forward speed. After crossing the 35th parallel, the storm was overtaken by a cold front early on the 8th.

DINAH

Tracking among the central and western Carolines since May 20, the embryo of Dinah was followed by aircraft reconnaissance and satellite pictures for several days. By the 26th, satellite pictures showed the Dinah system was springing to life west of Yap. The fact that Dinah was in the process of developing rapidly was verified by the Liberian freighter KONKAR RESOLUTE which crossed near the center and reported 60-kt. north-northwesterly winds and a minimum pressure of 988 mbs. The storm continued to intensify to 90 knots before striking the northern coast of Samar. She traversed the central Philippines and exited near Lubang Island. A peak gust of 93 knots was reported at Legaspi City in southern Luzon while Tayabos recorded a minimum pressure of 979.2 mbs. Dinah left in her wake 13 people dead and 44 missing in addition to 6,500 homes destroyed.

Emerging into the South China Sea, Dinah dropped briefly below typhoon strength for a 12-hr. period before intensifying to 80 knots. North of the Parcel Islands, she diminished to tropical storm force before striking eastern Hainan with 45-kt. winds. Dinah dissipated rapidly after entering southern China west of the Luichow Peninsula on the 30th.

FREDA

Freda was the first in a succession of six storms to cross the Philippine archipelago in a period of less than 4 weeks.

Freda developed to a tropical storm some 300 miles east of central Luzon on June 14. Her initial stages were traced back to the vicinity of the Palau Islands. Heading on a west-northwesterly track, Freda intensified to 65 knots just before she struck near Palanan Point, on northeastern Luzon, on the afternoon of the 15th. Gusts of 80 knots were reported at Vigan on the west coast when the center was emerging back out to sea, while 8.15 inches of rain fell at Baguio. Damage was considerable over northern Luzon but no estimates are available.

Moving into the South China Sea, the storm remained near minimal typhoon strength and began to bend toward the northwest. Freda's center passed 50 miles south of Pratas Island and struck the mainland between Macau and Hong Kong on the 18th with maximum sustained winds of 50 to 55 knots. Wind gusts of 70 knots were experienced at Tate's Cairn and up to 103 knots at the Royal Observatory which also registered a minimum pressure of 984.3 mbs. A total of seven deaths was attributed to Freda, five of which occurred in Luzon, the other two in Hong Kong.

GILDA

After a 700-mile journey, Gilda struck the central Philippines as a newly formed typhoon on the morning of June 25. Gilda's origin dates back to the 18th as a weak circulation south of Yap when the ESSA 9 Satellite photographed her as a suspicious disturbance.

Upon slamming into Samar, Gilda crossed Masbate Island, the Sibuyan Sea, Mindoro, and set out to sea near Lubang Island. Maximum wind gusts of 90 knots were reported at Romblon in the Sibuyan Sea, while the typhoon dumped 7.44 inches of rain at Borongon. In the aftermath, one person was reported killed and over 790 homes were destroyed in the Philippines.

Gilda did not drop below typhoon force during her transit through the Philippines and emerged into the South China Sea with winds of 85 knots on the 26th. Shifting to a more northwesterly track at 15 knots, the typhoon struck northeastern Hainan Island 36 hours later with winds of 90 knots. Gilda moved ashore on mainland China, west of the Luichow Peninsula, before dissipating in the interior.

HARRIET

Harriet, reminiscent of Typhoon Gilda, cut through the Leyte Gulf region of the central Philippines on July 3. Developing from a circulation first noted near Yap, Harriet intensified to tropical storm force some 24 hours before striking Samar Island. Packing 50-kt. winds as she accomplished landfall near Tacloban, the storm emerged from the Philippine archipelago near Mindoro Island 1 day later and rapidly attained the classification of typhoon.

Setting out to sea on a west-northwesterly heading at 17 knots, Harriet began to wind up. Intensification culminated on the 5th when reconnaissance aircraft estimated maximum winds at 125 knots. Unusually strong for a South China Sea typhoon, Harriet began to slow and, fortunately, weaken before reaching the Vietnam coast. By the morning of the 7th, winds dropped to 70 knots as the storm made landfall.

Moving into the DMZ, the typhoon literally washed out the war on South Vietnam's northern front. Harriet, preceded by day-long rains and high winds in the northern provinces, blotted out ground fighting and heavily cut into U. S. air strikes. A maximum 24-hr.

rainfall of 10.16 inches fell at Camp Evans, which also registered sustained winds of 45 knots and gusts to 61 knots in the typhoon's southern quadrant.

In its aftermath, Harriet left one person dead in the Philippines and four dead and 14 missing in Vietnam. Thau-thien Province in Vietnam suffered. Over 2,500 houses and buildings were partly or completely destroyed.

JEAN

As Jean came onto the scene, the Philippines and Vietnam became the target of July's second typhoon. Attaining 50-kt. winds on July 10, Jean weakened temporarily to depression status while describing an erratic track during the 11th. Regaining strength and commencing a west-northwesterly track north of the Palau Islands, Jean's center passed near the British vessel SIMONBURN on the morning of the 13th. The ship reported force 10 winds (48-55 knots), very high seas, and a pressure reading of 987 mbs. Attaining typhoon strength that afternoon about 270 miles east of the Leyte Gulf, Jean followed a similar track across the central Philippines during the 14th and 15th as that taken by Gilda and Harriet. Highest winds reported in the archipelago were 65 knots at Catbalogan, on the western coast of Samar, while gusts of 70 knots were measured at Virac on Catanduanes. Winds up to 38 knots were also experienced in high and exposed areas of the greater Manila area. Over 7 inches of rain fell in a 2-day period over Samar. No reports of casualties and damage are available; however, low-lying areas of Manila encountered local flooding.

Regaining typhoon winds over open water about 24 hours later, the typhoon changed course to a northwesterly heading. Skirting southern Hainan Island on the 17th, Jean's winds dropped to storm status before she struck shore near Vinh on the Indochina coast on the 18th. The storm dissipated over the mountainous terrain of Laos later that day.

LUCY

The second supertyphoon of the year showed her early signs of origin on July 11 as a circulation in the equatorial trough near the Truk Islands. After a 5-day journey which brought the system into the Philippine Sea, Lucy became a tropical storm at a point 750 miles east of Manila.

While Typhoon Jean was churning the waters of the South China Sea, aircraft reconnaissance measurements noted a steady reduction in Lucy's central pressure once she became a typhoon on the 17th. Thirty hours later, a dropsonde reading in the eye indicated Lucy had bottomed out at 915 mbs. the morning of the 19th, indicating that the supertyphoon level (130 knots) had been reached. The typhoon headed for Luzon Strait on a west-northwesterly track of 8 to 9 knots. Navigating the Strait, Lucy weakened slightly and passed 50 miles south of the Bataan Islands on the afternoon of the 20th. The Philippine Weather Bureau station at Basco registered a maximum sustained wind of 103 knots during Lucy's passage. The circulation associated with the typhoon had grown to a diameter of 600 miles by this time. Manila, located 300 miles to the south, came under strong southwesterly winds of 16 to 25 knots with gusts to 30 knots. Lucy not only buffeted northern and central Luzon with destructively strong winds but also dumped heavy rains which caused severe flooding and landslides. Baguio, during this period, reported a 24-hr. rainfall total of 14.92 inches.

In Taiwan, the highest winds reported were at Lanyu (64 knots with gusts to 85 knots). Rainfall was considerably less in Taiwan with a maximum 24-hr. amount of 4.97 inches measured at Taitung. Casualty reports in Taiwan listed two persons killed and five missing.

Lucy weakened to tropical storm force as she continued on her westerly course for the south China mainland. Striking the coast 15 miles northeast of Hong Kong, gusts of 80 knots were measured at Tate's Cairn in the colony while a minimum pressure of 977.9 mbs. was observed at the Royal Observatory. The storm continued to weaken as it moved inland and finally dissipated in the northern interior of the Luichow Peninsula.

MARY

Detected by satellite, Mary was confirmed by reconnaissance aircraft on July 17 to be of tropical storm force halfway between Wake and Ocean Station Victor (34° N., 164° E.). With Jean in the South China Sea and Lucy in the Philippine Sea, Mary increased the simultaneous storm count in the western Pacific to three.

Reaching minimal typhoon strength the following day, Mary traced a northwesterly course as peak winds near the center reached 80 knots. On the 19th, Mary passed 150 miles west of Ocean Station Victor and diminished to storm status as she shifted to a northerly heading. By the morning of the 21st, Mary was beyond the range of reconnaissance aircraft as she accelerated to a speed of 16 knots. That afternoon satellite pictures indicated that cooler air had taken hold of the storm as it headed northeastward. Shortly thereafter, Mary was an extratropical storm.

NADINE

As Typhoon Lucy was reaching supertyphoon strength in the Philippine Sea, another circulation, destined to be Nadine, formed southeast of Guam on July 16.

During her formative stages the preNadine system dumped 6.05 inches of rain on Guam over a 3-day period, causing local flooding on the island as she passed into the Philippine Sea. Evidence that Nadine was on her way to intensification was provided by the AMERICAN CHARGER which reported northerly winds at 47 knots about 75 miles due west of the center at 2200 G.m.t., on the 20th. Nadine took a track slightly north of Lucy's as the ridge began to build across to the north, dictating a west-northwesterly course of 8 to 10 knots. Quickly reaching typhoon force, Nadine began to grow both in size and strength. The central pressure commenced to plummet rapidly and gale-force winds began to spread. At her height, the minimum pressure reported by reconnaissance aircraft was 898 mbs. some 300 miles northeast of Luzon on the 24th. At this time, maximum winds of 150 knots were packed around Nadine's 20-mi. diameter eye. One hundred-knot winds spread some 100 miles from the center, while gale-force winds encompassed the western Philippine Sea more than 300 miles from the typhoon's eye. As Nadine approached Taiwan, gales were felt as far south as Manila which reported gusts to 33 knots. The Philippine Weather Bureau station on Basco in Luzon Strait measured wind gusts of 127 knots (probably due to channeling in the Strait) as Nadine's center passed 100 miles to the northwest. Nadine's eye landed on the southeast coast of Taiwan between Hsinkong and Taitung during the early morning of the

26th. The typhoon brought torrential rain to southeastern Taiwan with 12.07 inches recorded at Hengehan during its passage. Lanyu recorded maximum winds of 95 knots and gusts to 99 knots.

The toll in Taiwan amounted to 28 people killed with an additional 25 missing. Over 1,250 homes were totally destroyed and some 2,180 dwellings were badly damaged. In addition, the Liberian tanker WARWICK TRADER dragged her anchor and became lodged in the soft sand off the southwestern coast of Taiwan.

OLIVE

Olive climaxed the most active July on record when another in a succession of circulations in the equatorial trough formed east of Guam on July 24. After drifting over Guam, the system took a northward bend. Commencing on a northeasterly drift, the circulation began to grow in size but did not become better organized. By the 29th, a rather complex cloud system was in evidence as viewed by satellite. As the subtropical ridge began to strengthen, the depression began to slowly intensify and start an erratic, meandering, westerly track, reaching storm status early on the 31st. Switching to a northwesterly direction, Olive finally achieved typhoon force the night of August 2. The typhoon reached her peak intensity of 85 knots some 48 hours later as she neared Yaku Shima Island in the northern Ryukyus.

With the approach of a long-wave trough off the coast of China, the typhoon swung to a northerly track with Olive's center driving through western Kyushu, east of Nagasaki, on the 5th. Crossing the Ryukyus, the highest winds and lowest pressure were reported at the Japanese Yaku Shima station--80-kt. winds gusting to 119 knots and a 938.7-mb. pressure.

Torrential rains, measuring up to 59.8 inches in the mountainous regions of Kyushu (Ebino, Miyazaki Prefecture), accounted for numerous landslides and for 69 persons killed, 209 injured, and over 1,700 dwellings partly or completely destroyed. At sea, the 7,935-ton motorship KAMO MARU was forced aground off Hesaki Lighthouse, the 975-ton SHINMEI MARU ran aground 6 miles west of Anami O-Shima, and the 6,248-ton Indian motorship KRISHNA JAYANTI suffered a power failure and steering gear disorders off Kyushu Island as a result of the storm.

Weakened considerably by its traverse of Kyushu, Olive entered the Sea of Japan as a tropical storm and paralleled the Korean coast before turning to a northeasterly course and becoming extratropical.

ROSE

During her early life, Rose was in a class of midget typhoons having an areal extent of 100 to 150 miles. Before her life cycle was spent, however, Rose had the distinction of being the most disastrous typhoon of the 1971 season.

A small circulation was evident in synoptic and satellite data as early as August 7 at a position north of Truk. On the evening of the 9th, the radars at Fleet Weather Central Guam and Anderson AFB, Guam, detected a small circulation with spiraling convection passing just north of Guam. Aircraft investigation the following morning revealed a mini-storm with 35- to 40-kt. winds. By the late afternoon, Rose coiled to minimum typhoon strength with no increase in size and set out on a westerly 14- to 15-kt. course for Luzon. Except for a 12-hr. period during the late afternoon and evening of the 11th, Rose remained at typhoon strength as she navigated the Philippine Sea and gradually generated winds to 110 knots before striking Luzon.

Making landfall north of Palanan Point, Rose crossed the mountainous terrain of northern Luzon and emerged in the South China Sea as a minimal typhoon. While inland, the Philippine Weather Bureau station at Tuguegarao reported maximum winds of 75 knots, and the barometer dipped to 986.5 mbs. during center passage.

Rose had been steered for several days by a strong high cell centered near Shanghai. This cell began to weaken significantly as Rose began her journey in the South China Sea. In response to the synoptic-scale changes, the typhoon shifted to a more northwesterly course and began to slow to 6 to 7 knots in forward movement later on the 15th.

The eye of the storm began to appear on the radar at the Royal Observatory the afternoon of the 16th. A ship report in the vicinity of the eye confirmed that the deepening trend had continued to 950 mbs. At this time, the NUDDEA reported winds of 90 to 110 knots close to the center. Considering the last reports from aircraft penetration of Rose and the continued deepening trend, the typhoon probably peaked near 120 knots before weakening slightly when the eye arrived at Lantau Island off Hong Kong shortly after midnight of the 16th. Moving inland on the 17th, the storm weakened and dissipated northeast of Canton the following day.

Meteorological extremes measured within the colony showed a minimum pressure of 963.2 mbs. at Cheang Chau after midnight while a maximum gust of 121 knots was reported at the Royal Observatory. The 11.34 inches of rain which fell at the observatory during the 24 hours of Rose's passage was the highest value ever recorded in 1 calendar day during August.

Typhoon Rose was probably one of the most intense and violent typhoons that has affected Hong Kong. Twenty-six ocean going vessels went aground and two were sunk. Table 4 lists the name, nationality, and gross tonnage of the affected ships. A total of 130 deaths was attributed to the typhoon and over 5,600 people were made homeless. Also, in the harbor, some 300 small crafts, including 100 pleasure crafts, were sunk or damaged.

The Macao ferry FATSHAN capsized, resulting in the loss of 76 lives, and is regarded as one of the worst maritime disasters in the colony's history.

SHIRLEY

Noted as a disturbance for several days in satellite photographs, the existence of a circulation 300 miles southwest of Marcus Island was confirmed by reports from the HAWAII BEAR on August 11. Aircraft reconnaissance early on the 13th revealed the status of the system as a tropical storm with 55-kt. winds. Shirley was positioned some 250 miles southeast of Iwo Jima.

Situated in a weak area of the subtropical ridge, the storm remained quasi-stationary for 12 hours before it shifted to a northerly course at 5 knots and acquired typhoon strength during the evening of the 13th. Continuing on a northerly course along the western periphery of a high cell centered south of Ocean Station Victor (34° N., 164° E.). Shirley's forward movement gradually increased to 15 knots over the next 4 days. Maximum winds during her lifetime reached 90 knots on the 16th at a position 400 miles east-southeast of Tokyo. As the westerlies began to take hold, Shirley shifted course toward the northeast and accelerated to 40 knots while retaining her in-

tensity. Shirley transformed to extratropical characteristics east of Hokkaido late on the 17th.

Invaluable service was furnished by the Norwegian ship BONNEVILLE which responded to Fleet Weather Central Guam's request for 3-hr. ship reports during the uncertain forecast period from the 12th to the 14th. Peak winds of 42 knots were experienced by the BONNEVILLE early on the morning of the 12th.

TRIX

Spotted by satellite and ship reports some 200 miles southwest of Marcus Island on August 19, the disturbance destined to be Trix quickly generated to tropical storm force by the following day. As steering currents were weak, Trix drifted northward at 6 to 7 knots, and was classified as a typhoon during the night of the 21st 100 miles west of Marcus Island. On the 22d, the storm remained nearly stationary for 24 hours. Then Trix began tracking westward on a heading that took her near Iwo Jima on the morning of the 26th. Winds of 35 knots with gusts of 45 knots were recorded on the island as the typhoon passed 40 miles to the north. The storm then took aim for the northern Ryukyus and began to slowly intensify on the 27th. Trix slowed to 8 knots and her central pressure began to plummet before recurving on the 29th. About 30 miles south of Yaku Shima, aircraft reconnaissance measured maximum sustained winds of 100 knots concentrated around a tight 8-mi. diameter eye. As Trix passed through the northern Ryukyus, the Japanese weather station on Yaku Shima Island reported winds of 66 knots gusting to 96 knots. Trix's center was only 20 miles to the west of Yaku Shima.

Following 3 weeks after Olive, Trix struck Kyushu at Cape Sata during the early morning of the 30th. She then paralleled the Japan coastline emerging from the Boso Peninsula as an extratropical system. The typhoon brought torrential rains to the Japanese islands with as much as 43 inches recorded in the mountainous terrain of Kyushu (Yangitake, Miyazaki Prefecture). The huge rainfall flooded many rivers and streams and caused numerous landslides. In addition, the weather halted the National Railways in Kyushu and paralyzed the nation's air and surface transport systems.

Forty-four deaths were reported, over 1,000 dwellings were partially or completely destroyed, and over 120,000 homes were flooded. A total of $50.6 million (U. S.) was lost in damage sustained to the rice, fruit, and vegetable crops. In addition, a series of tornadoes swept through the coastal port of Chiba City accounting for one death as the weakened extratropical stages of Trix passed back out to sea.

VIRGINIA

Aircraft reconnaissance located newly formed Tropical Storm Virginia some 500 miles northwest of Guam on the afternoon of September 1. Early signs of the system can be traced back on synoptic charts to a circulation which had its origin near the Palau Islands on August 30. Drifting north and then northeast, satellite pictures showed increasing character to the cloudiness of the system before reconnaissance investigation.

Like Trix, Virginia was in an environment of weak steering currents during her early stages, and thus began to drift slowly northward, intensifying to typhoon strength by the afternoon of the 4th. As Virginia passed 270 miles west of Iwo Jima, her winds peaked at 100 knots. Rounding the periphery of the high cell centered north of Marcus Island, the typhoon shifted to a north-northeasterly course during the afternoon of the 6th. On this heading, Virginia's center skirted the Boso Peninsula of Japan during the night of the 7th. As she merged with a frontal zone off of northern Honshu, Virginia weakened to storm force and became extratropical the following day. The strongest wind reported along the Japanese coast was 67 knots with gusts to 95 knots at the Chosi weather station.

Virginia interacted with a weak frontal area along the southern coast of Honshu causing torrential rain (up to 22 inches in a 24-hr. period at Katsuma) to fall along the coast, which triggered landslides and considerable flooding. Approximately 200 houses were totally or partially destroyed while over 13,800 dwellings were flooded. Hardest hit was the Chiba Prefecture where 56 persons were reported killed by the landslides which buried numerous homes.

WENDY

Destined to spend her entire life at sea, Wendy formed from a disturbance first noted by satellite on September 2 east of Wake Island. This system drifted southwestward and became a tropical storm just north of Wake Island on the morning of the 4th. As the storm began a slow drift of 2 to 5 knots in a northwesterly direction during the next 24 hours, winds of typhoon force were acquired. The effects on Wake resulted in 6.24 inches of rainfall during Wendy's passage with a sustained wind of 42 knots measured on the 5th and a gust of 50 knots registered on the 6th.

Intensification of the typhoon proceeded at a rapid pace until late on the 7th when peak winds of 140 knots were reached. Reports from reconnaissance crews at this time described one of the largest and most panoramic eyes of the year, a circular, closed-wall cloud with coliseum-like features encompassing an eye 40 miles in diameter.

After a stall during the 8th, Wendy commenced a northerly and later a northwesterly track. The area dominated by the storm's circulation began to spread to stretch over a vast region of some 900 miles in diameter. Wendy maintained her northwesterly track for 2 days before rounding the periphery of the ridge line. On the 11th, she began to recurve some 400 miles east of Japan. With a trough in the westerlies situated along the coast of Manchuria, the typhoon then began to accelerate in forward speed from 16 knots on the 12th to 37 knots on the 13th. Dropping to storm strength and merging with a frontal system east of Hokkaido, Wendy ended her life as a tropical system on the 13th.

The 9,968-ton Liberian freighter UNION WISDOM, bound from Yokohama to Montreal, was battered by Typhoon Wendy. Heavy damage resulted when the deck cargo shifted, and a 108-ton iron ring was lost overboard.

AGNES

The weak circulation which was to become Agnes had been followed on synoptic charts for close to a week in the west-central Philippine Sea. On September 14, satellite data and aircraft reconnaissance indicated the system was showing signs of development, and by the following afternoon September's third tropical storm had formed.

Guided by an extension of the subtropical ridge to the Ryukyus, Agnes slowly edged northward and then shifted

to a westerly course while she intensified to a typhoon on the 17th. Agnes continued to follow the weak ridge making landfall on Taiwan between Hualein and Ilan early on the evening of the 18th. After crossing Formosa Strait, the storm arrived on the China mainland near Nanchang and dissipated as it moved inland.

Winds of 58 knots gusting to 78 knots were felt on the islands offshore of northeastern Taiwan, while heavy rainfall produced by Typhoon Agnes amounted to 17.4 inches in 48 hours at Anpu in the mountainous terrain of the island. Flooding in Taipei was reported to be extremely serious as much of the lower areas of the city were badly inundated. Over 100 dwellings were partially or totally destroyed by the flooding. One person was reported killed and five others were missing.

BESS

September's fourth typhoon developed from a disturbance which can be traced back by satellite to a position between Wake and Marcus Islands on September 14. Three days later, aircraft reconnaissance located Bess about 300 miles east of the Marianas with associated maximum winds of 40 knots. Bess developed into a typhoon on the 18th, passing near Agrihan Island that afternoon. On the morning of the 20th, Bess had intensified further to be the season's fifth supertyphoon as 140-kt. winds spun around her 30-mi. eye. With the subtropical ridge extending to the Ryukyu chain, Bess proceeded on a steady west-northwesterly track with her forward speed gradually decreasing from 16 to 12 knots as she approached the southern Ryukyus. On the afternoon of the 22d, the typhoon passed a few miles south of Ishigaki Shima and crossed directly over Younaguni Jima. Bess's winds were measured at 91 knots gusting to 124 knots at the weather station on Younaguni Jima while Ishigaki Shima received 9.3 inches of rainfall during the typhoon's passage. The southern Ryukyu Islands reported two persons killed and more than 2,000 people made homeless. The islands were declared a major disaster area.

On the evening of the 22d, Bess--the second typhoon to strike Taiwan during September--moved inland over Taiwan near Ilan, which recorded a minimum sea-level pressure of 955.5 mbs. The eye of the storm, estimated at 40 miles in diameter, passed over Taipei between 2220 and 2305. Highest sustained winds recorded were 108 knots at Pengachiayu, and the maximum gust observed was 130 knots at Keelung. A storm surge of 9.9 feet was experienced at Tanshui on the island's northern coast during the passage of the eye. Bess emerged over Formosa Strait as a minimal typhoon during the early morning of the 23d near Taoyuan, and struck mainland China near Fuichow that afternoon. The storm weakened to depression status over land. Then, drifting northward, she recurved and crossed the Yellow Sea as an extratropical system.

Flooding in Taipei was extreme in places, and all main roads branching out of Taipei were made temporarily impassable by the storm. The torrential rainfall in the mountainous terrain amounted to 18.7 inches at Alishan. The typhoon was also responsible for serious damage to rice, sugarcane, and banana crops. In total, Bess accounted for 30 deaths, six persons missing, and over 2,200 dwellings destroyed.

DELLA

Della cut across northern Luzon on September 27 as an intensifying tropical depression. Early signs of her existence can be traced to the central Philippine Sea near 14° N., 130° E., on the 25th, as evidenced by satellite and ship data. Emerging into the South China Sea, Della was guided on a westerly track by an extension of the subtropical ridge into south China. Della developed to minimal typhoon force (70 knots) late on the 28th, bringing the month's typhoon total to five. After her transit of Hainan Island on the 29th, Della crossed the Gulf of Tonkin on the following day, arriving ashore on the Vietnam coast late in the day near Vinh. The remains of the storm dissipated shortly thereafter over northern Laos.

ELAINE

Elaine became the second storm to generate to typhoon force over the South China Sea within a week. The early stages of Elaine tracked into the Philippine Sea on a 5-day journey from the central Carolines, and developed to minimal tropical storm strength shortly before she skirted the northern coast of Samar Island the evening of October 3.

Crossing the central Philippines at a 13-kt. forward speed, Elaine exited south of Lubang Island 24 hours later. Extensive crop damage was reported to have been caused because of the typhoon's transit of the islands. Maximum winds of 50 knots were registered at the Virac weather station on Catanduanes Island while up to 7.8 inches of rainfall was recorded at Calapan on Mindoro.

Elaine began to slow and stall west of Luzon. As the weak steering currents persisted, the storm slowly drifted in a general northwesterly direction and intensified to 100 knots. By the 7th, the subtropical ridge began to build and Elaine swung back to a westerly track skirting southern Hainan early on the 9th. Dropping to tropical storm status, Elaine traversed the Gulf of Tonkin, driving ashore on the Vietnam coast north of Dong Hoi. She quickly weakened and later dissipated over Laos.

During the time frame when Elaine stalled in the South China Sea, the envelope of gale-force winds expanded in size to 300 miles in radius. Fifty-knot winds extended 200 miles out into the southern quadrant. An extensive southwesterly fetch caused huge waves to strike the western coastal region of the northern Philippines. Close to 10,000 persons had to be evacuated from the shore areas. Destruction from the heavy seas amounted to 2,400 homes completely demolished.

The heavy seas were also responsible for a number of maritime casualties. The Philippine interisland passenger ship TACLOBAN was sunk in Tablas Strait with three persons reported killed. The pump boat SARANEL was capsized by big waves off the coast of Siguigas Island in the Mindanao Sea with only four of its 30 passengers surviving. Immobilized south of the typhoon, the American ship STEEL VENDOR was run aground on the Loaita Bank in the South China Sea. The sinking Panamanian tanker KEELUNG, 240 miles west of Manila, had to be abandoned by its crew in the heavy seas generated by Elaine. In another incident, the 17-man crew of the sinking Formosan fishing boat CHI-SHING TAN abandoned ship during heavy seas in the South China Sea at the height of typhoon Elaine. The crew was rescued.

FAYE

Faye was first sighted as a weak entity in satellite

pictures south of Johnson Island as early as September 27. Ill-defined, the system drifted west-northwestward for a week, making passage near Eniwetok on October 3 as the U. S. Coast Guard station on the atoll reported a sharp wind shift. By the 4th, satellite pictures detected signs of organization in the cloudiness. An aircraft investigation early the following morning located a tropical storm with 50-kt. peak winds some 700 miles east of the Marianas. Faye sailed along at 16 to 21 knots briefly reaching typhoon strength late on the 5th. Returned to tropical storm classification, Faye passed just north of Saipan the following afternoon. Faye continued on a westerly heading during the next 24 hours, gradually weakening and appearing to dissipate late on the 7th. With a rather complex circulation pattern in the Philippine Sea at this time, it is possible that the system may have been absorbed in a larger circulation to the south. However, for the 2-day period of the 8th and 9th, all available reconnaissance, surface, and satellite data indicate a considerable amount of uncertainty in this portion of Faye's track. Redevelopment over the Philippines may possibly not have been retraceable to the initial system.

After regaining minimal storm strength on the 9th in the Lamon Bay region, Faye crossed Luzon on a westerly track north of Manila. Once in the South China Sea, she intensified to typhoon strength but then grinded to a halt on the 11th, 45 miles northeast of Scarborough Shoals. Commencing a highly unusual track toward the southeast, Faye cut across Luzon for the second time, by then weakened to tropical storm force. The storm passed south of Manila. The highest winds reported during Faye's second Philippine transit were 42 knots at Calapan on northern Mindoro. Emerging into Lamon Bay after being greatly modified by cooler air from the north, the remains of Faye slowly moved northeastward and acquired extratropical characteristics as they merged with a weak frontal zone south of the Ryukyus.

The effect of Faye on the city of Manila was considerable as heavy rains flooded much of its lowlying areas. The torrential rainfall from Faye in combination with that of Tropical Storm Gloria, which struck northern Luzon late on the 10th, was responsible for measured 24-hr. amounts up to 10.78 inches at Casiguran. The flooding caused evacuation of many towns in Luzon, leaving thousands homeless. Streams already swollen by rains from Typhoon Elaine and Tropical Storm Gloria overflowed their banks, swept away bridges, and submerged crops and homes. At least 13 deaths with an additional 80 persons counted as missing were reported in the aftermath of Gloria and Faye. Offshore, the heavy seas generated by Faye forced the inter-island vessel JOLO aground near Corregidor at the mouth of Manila Bay, while in Palawan Island a pump boat was reported to have sunk with one of its 11 crewmen counted as missing.

HESTER

One of the most devastating typhoons to strike Vietnam in over a decade developed from a circulation just west of the Palau Islands. Hester attained tropical storm strength late on October 19 about 250 miles east of northern Mindanao. Crossing the southern Visayas, she intensified to typhoon force over the Sulu Sea on the 21st. Later that evening, Hester cut across northern Palawan Island and moved over the South China Sea, leaving behind some six persons killed and two missing in the southern Philippines.

Hester then accelerated to 18 knots in forward speed on a west-northwesterly course, or twice the climatological average for typhoons in that region during October. Hester continued to intensify to 90 knots during her 1-1/2-day track across the South China Sea. Arriving ashore on the Vietnam coast during the morning of the 23d, the typhoon's eye passed just south of Chu Lai. Moving inland, the center tracked south of Hue and diminished in strength. The storm rapidly dissipated over central Laos that evening.

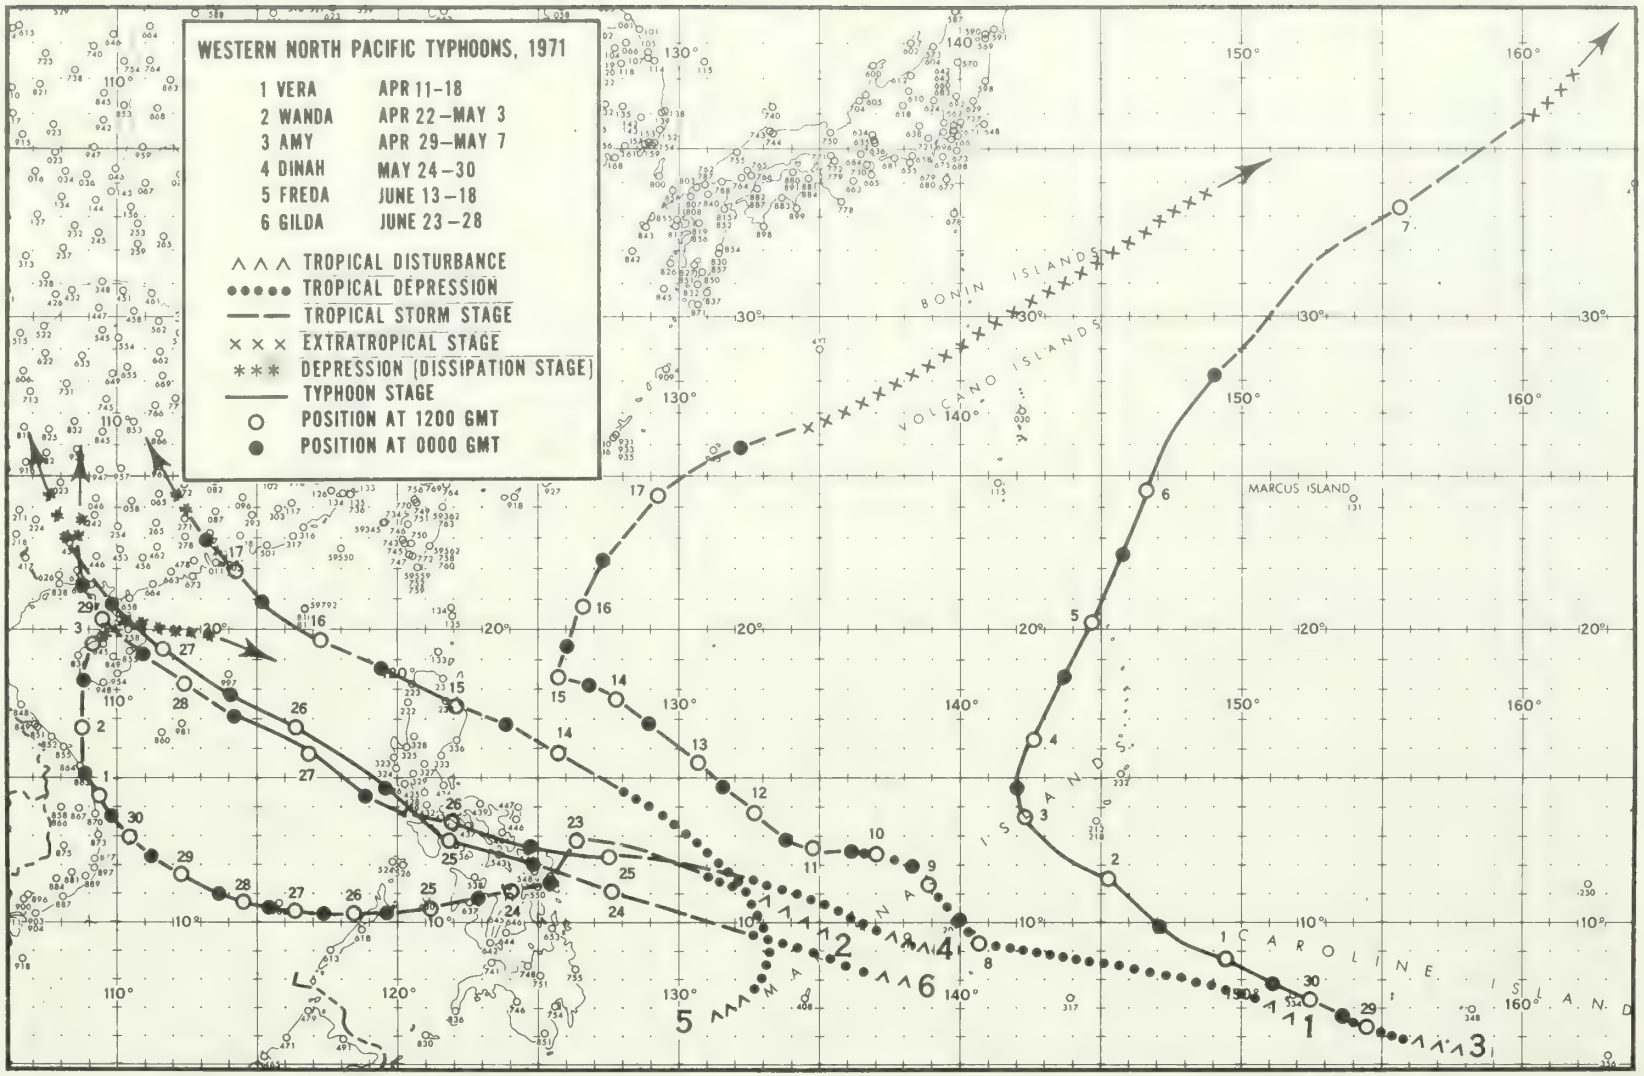
Maximum sustained winds at Da Nang were registered at 60 knots with gusts to 85 knots during Hester's passage. Maximum gusts of 70 and 71 knots were reported at Camp Eagle and Hue, respectively. The lowest pressure of 971 mbs. was measured at Chu Lai where maximum winds of 70 knots gusting to 90 knots were estimated. Heaviest rainfall measured was at Camp Eagle with 5.44 inches.

Extensive damage was suffered at American bases, including Camp Eagle and the air and naval facilities at Da Nang. Heaviest hit was Chu Lai with 75 percent of its structures receiving damage. Thirty-eight helicopters were destroyed and four hangers collapsed, while 87 other aircraft (mostly helicopters) received damage. Three American lives were lost because of flying debris.

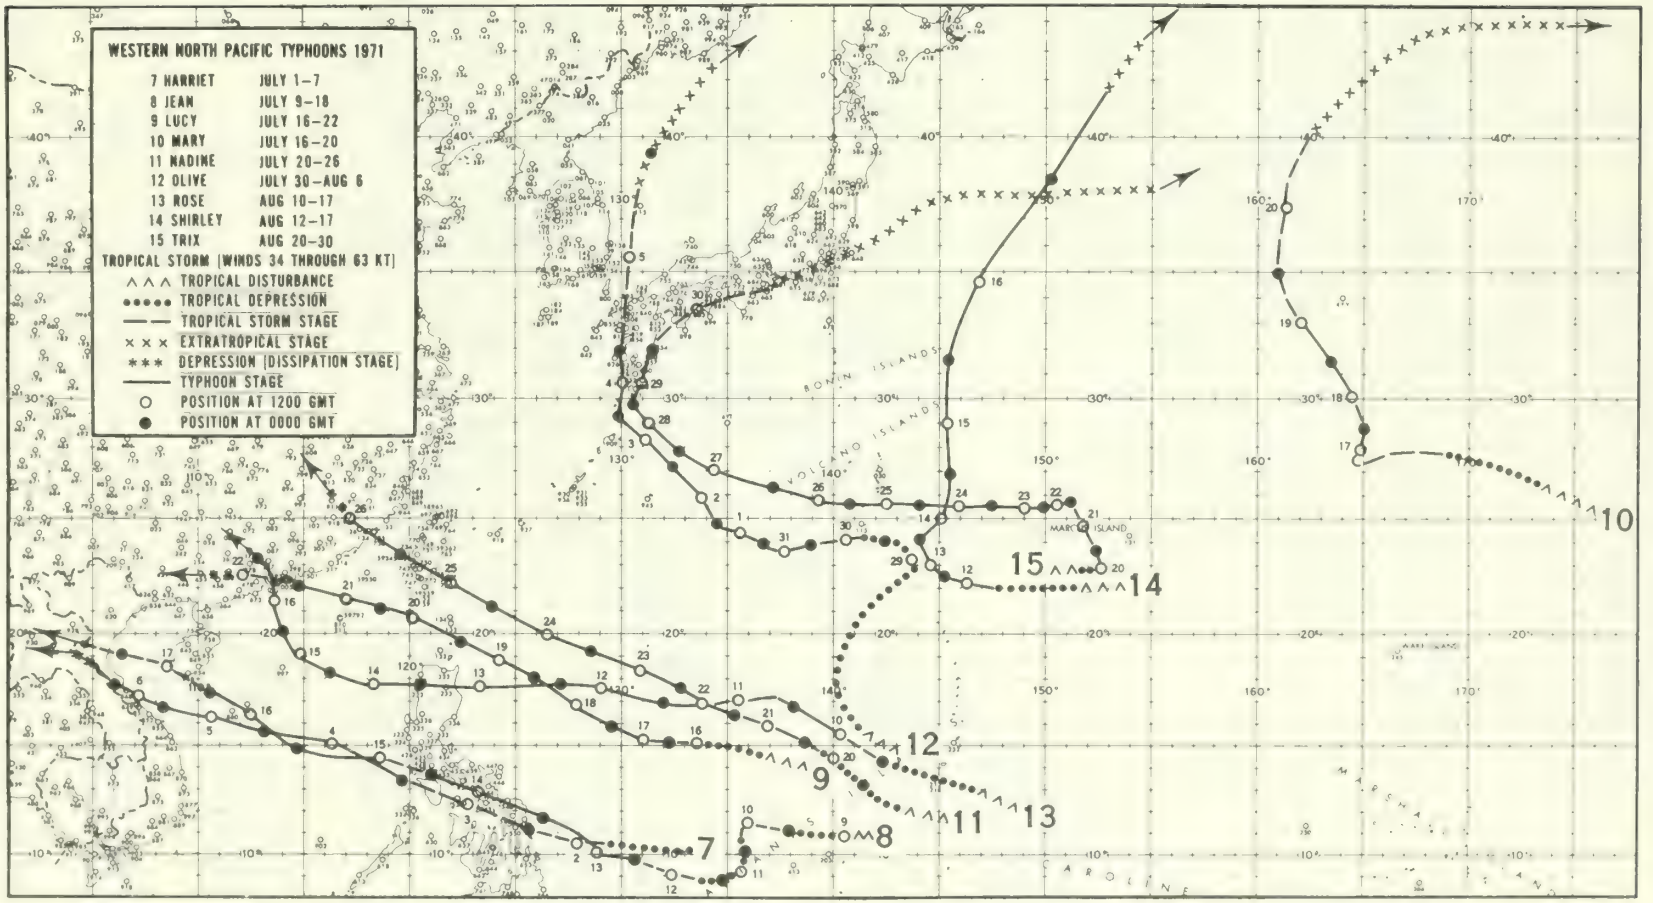
Over 200 miles of coastal area were flooded from Quang-tri to Da Nang while 90 percent damage was sustained to houses in Quang Ngai. Severe damage to crops was reported and loss of cattle amounted to close to 900 head. Maritime casualties accounted for some 500 fishing boats reported sunk or destroyed, and the 1,000-ton UNION PACIFIC ran aground north of Chu Lai.

In total, newspaper reports indicate some 85 Vietnamese were killed and over 200,000 rendered homeless because of Hester. The Republic of Vietnam's social welfare department regarded the typhoon as the worst to strike the country since 1944.

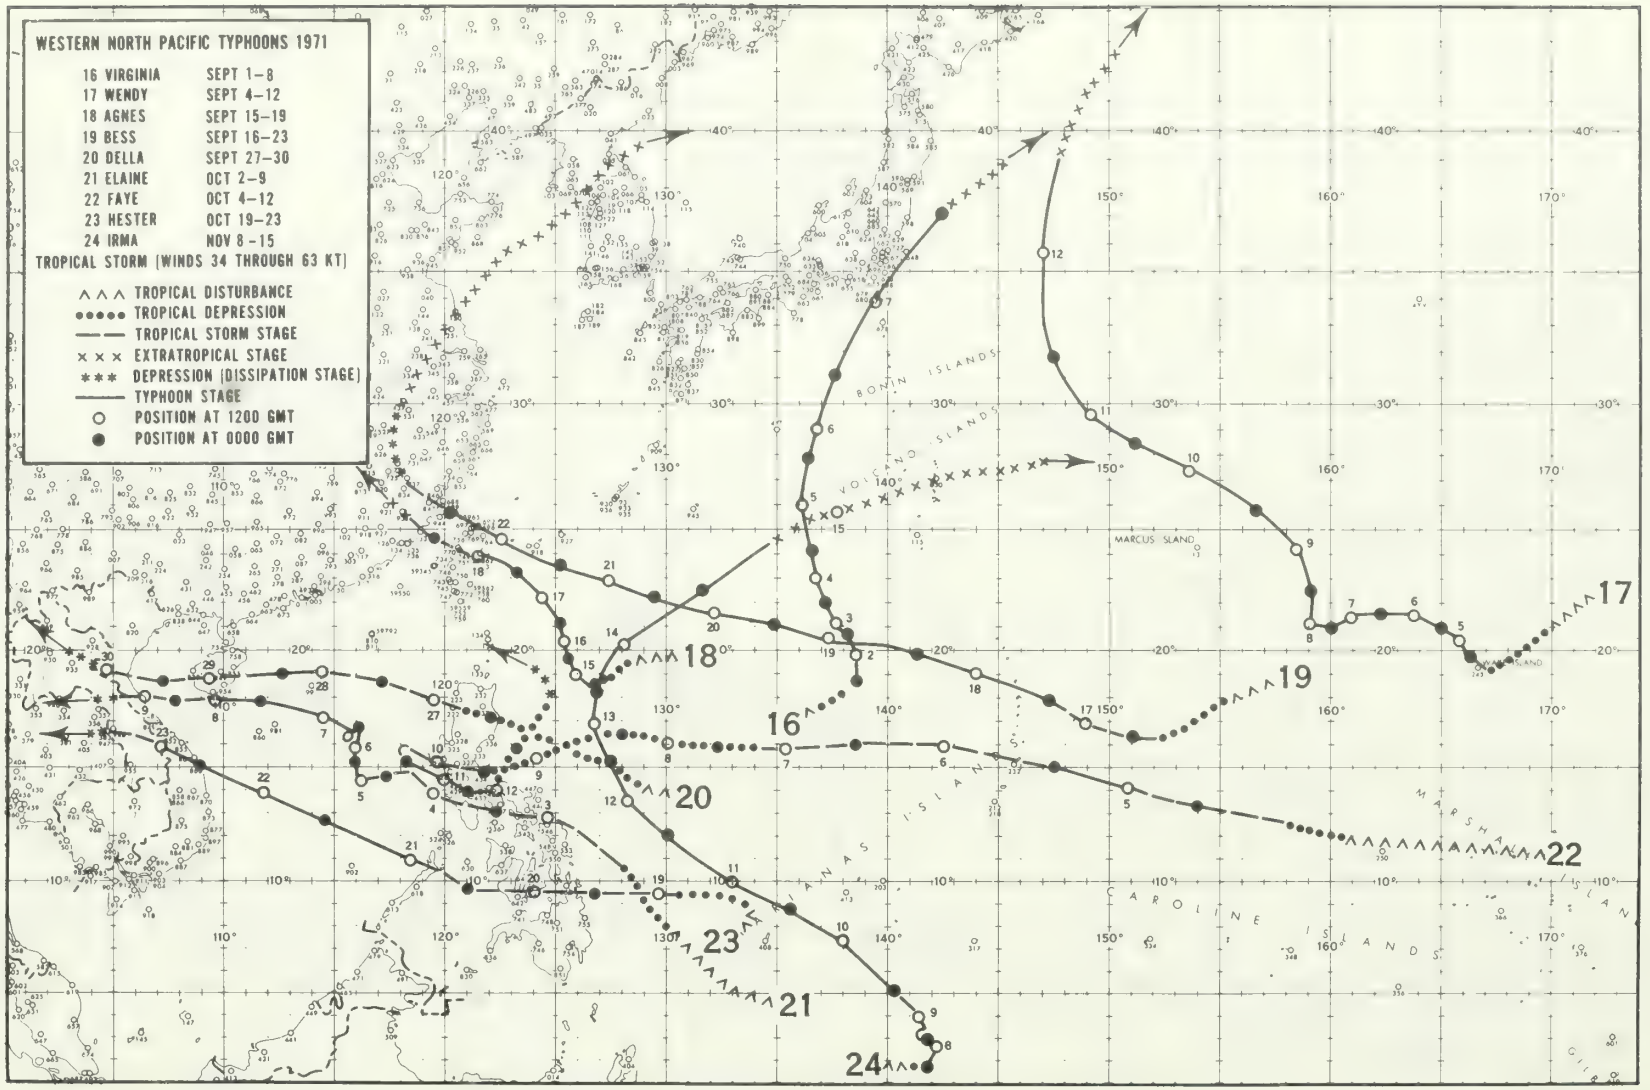
IRMA



The last and most intense typhoon of the year was first noted on synoptic charts as a quasi-stationary circulation in the western Carolines on November 2. Early on the 8th, the ESSA 8 satellite data showed that the cloudiness associated with the system was showing increased organization--Tropical Storm Irma was born. Later in the afternoon, Woleai Atoll reported winds of 30 knots with gusts to 50 knots as the storm center was located by reconnaissance aircraft 50 miles west of the station. Reports from Eauripik Atoll indicated that high seas had inundated 200 feet inland, and several houses were washed away. Irma's track was erratic for the next 24 hours until she began a northwesterly heading, passing 30 miles west of Ulithi the morning of the 10th. Reports from the atoll indicated 30-kt. winds with gusts to 60 knots and a minimum sea-level pressure of 996.3 mbs. In the Yap district, only Fais and Ulithi atolls had appreciable damage and this was limited to crops. Reaching typhoon force the evening of the 10th, Irma described a smooth northwesterly track, attaining supertyphoon status late on the 11th. The central pressure had plunged drastically during the day as evidenced by a 1600 G.m.t. reconnaissance aircraft measurement of 884 mbs. The observation ranked Irma's central pressure among the lowest on record.[1] Reaching peak winds in excess of 150 knots, Irma remained at supertyphoon strength for a 36-hr. period until she began to recurve around the subtropical ridge at 127° E. Paralleling the Ryukyu Island chain and accelerating in forward speed as she came under the



influence of the westerlies, Irma transformed to extratropical characteristics as she sped south of Honshu on the 15th at 35 knots. During the passage of the eye 65 miles east of Okinawa, the highest winds experienced on the island were at Naha which recorded 48-kt. gales, gusting to 80 knots, while Kadena AB reported 45-kt. winds with gusts to 64 knots.



At sea, the 2,474-ton Panamanian HUALIEN was run aground (presumably by heavy swells) at Peng Chia Hsu Island northeast of Taipei. The 13,616-ton Liberian ore carrier BANALUNA, bound from Leyte Island, Philippines, to Tobata, Japan, was reported missing and feared to have gone down during Irma. The 8,151-ton U. S. flagship AMERICAN COURIER, from New York for Subic Bay, reported that she lost one-half the stock of her starboard anchor.

---

[1] Minimum pressure on record is 877 mbs. measured by aircraft dropsonde in the eye of typhoon Ida on Sept. 24, 1958.

GENERAL SUMMARY OF FLOOD LOSSES FOR 1970

Elmer R. Nelson and Raymond J. Haley
Office of Hydrology, National Weather Service

Monetary losses from floods in the United States during 1970, estimated at $225 million, was the lowest since 1966. In comparison to 1969, it was 25 percent of the $903 million reported. Flood losses during 1970 were 50 percent of the 20-year (1951-1970) national average flood loss of $450 million (adjusted to the 1970 price index.). Destructive overflows have caused property damage in some years estimated at more than $1 billion.

Total loss of life in 1970 from floods was 135 compared to 297 in 1969. This is the third greatest loss of life reported since 1955 when 302 lives were lost. In comparison with the national average of 83 lives lost during the last 46 years (1925-1970), it was 1.6 times greater.

The most damaging floods during 1970 occurred in the Sacramento Basin in California during January, in the Colorado Basin in Arizona during September, and in Puerto Rico during October.

The largest rise in the Sacramento Basin occurred in the upper portion at Ord Ferry, Calif., where the warning stage was exceeded by over 9 feet. Early warnings by the National Weather Service permitted evacuation of all people and farming equipment from the Yolo Bypass islands before they were flooded. River levels reached on the Sacramento were the highest since the construction of Shasta Dam and natural flows may have been the highest since records began. The total damages in the Sacramento Basin were estimated at $38 million and the loss of life at 18.

Unprecedented flash floods occurred during September in the central mountains of Arizona and in the four corners area of Utah, Colorado, Arizona, and New Mexico. The flooding in central Arizona was of record proportions. Of the 23 lives lost, 14 died attempting to flee the campground just below the Mogollon Rim, about 30 miles northeast of Payson, Arizona. The heavy loss of life, the magnitude of the flooding and the devastation resulting from the unprecedented rains made the Labor Day weekend calamity the greatest natural disaster in the history of the state of Arizona. Damage from the flooding was estimated at over $5 million.

Major floods occurred in the eastern two-thirds of Puerto Rico during the early part of October. This flood was one of the most severe natural disasters to strike Puerto Rico during modern times. It was comparable to some of the famous severe weather disasters that have affected Puerto Rico in recorded history, including the notorious hurricane disasters of September 13, 1928, and August 8, 1899, known as the San Felipe and San Ciriaco hurricanes. The total property damage was estimated at $62 million. At least 50 people lost their lives due to mud slides and the floods.

ANNUAL FLOOD LOSSES FOR UNITED STATES

Annual Flood Losses and Savings for years 1933 to 1947, inclusive, have been published in the Monthly Weather Review as follows:

Year	Issue	Pages
1933	Vol. 62, No. 1, Jan. 1934	25-27
1934	Vol. 62, No. 12, Dec. 1934	465-467
1935	Vol. 63, No. 12, Dec. 1935	362-365
1936	Vol. 65, No. 1, Jan. 1937	28-31
1937	Vol. 66, No. 12, Dec. 1938	426-430
1938	Vol. 68, No. 9, Sept. 1940	262-263
1939	Vol. 68, No. 11, Nov. 1940	329-330
1940	Vol. 69, No. 7, July 1941	217-218
1941	Vol. 71, No. 11, Nov. 1943	185-186
1942 & 1943	Vol. 73, No. 8, Aug. 1945	137-139
1944 & 1945	Vol. 76, No. 6, June 1948	113-116
1946	Vol. 76, No. 9, Sept. 1948	208-210
1947	Vol. 77, No. 9, Sept. 1949	262-265

Beginning with flood losses for the year 1948, annual flood loss data are published in Climatological Data National Summary as follows:

Year	Issue	Year	Issue
1948	August 1950	1960	Annual 1961
1949	Annual 1950	1961	Annual 1962
1950-1951	Annual 1951	1962	Annual 1963
1952	Annual 1952	1963	Annual 1964
1953	Annual 1953	1964	Annual 1965
1954	Annual 1955	1965	Annual 1966
1955	Annual 1956	1966	Annual 1967
1956	Annual 1957	1967	Annual 1968
1957	Annual 1958	1968	Annual 1969
1958	Annual 1959	1969	Annual 1970
1959	Annual 1960		

Prior to 1933 Flood Losses and Savings were published monthly, as a rule, in the Monthly Weather Review.

*Damage estimates under this heading usually refer to losses of income and wages due to suspension of business, and costs of emergency protection evacuation, rehabilitation and relief **Most figures are based on flood damage surveys conducted by the National Weather Service, or are estimates contained in reports of District Offices, Corps of Engineers U.S. Army A Includes all residential losses B Includes all agricultural losses. C. Includes all urban losses. D. Includes all commercial losses. E Includes $3,000.0 in Tonto National Forest. F. Includes 14 lives lost in Tonto Creek watershed alone G. Includes 33 persons missing.

DISTRIBUTION OF ESTIMATED FLOOD LOSSES IN THE UNITED STATES BY MAJOR RIVER SYSTEMS, 1925-1970

WEA 103G

USCOMM ESSA-DC

LOSSES IN INDIVIDUAL SEVERE FLOODS IN THE UNITED STATES SINCE JULY 1902

Property Losses in Thousands of Dollars

Date	Location	Lives #	Property
May-June 1903	Kansas, Lower Missouri, and Upper Mississippi Rivers	100	$ 40,000
July 1908	Red River	---	16,200
March 1912	Lower Mississippi River	---	70,000
March 1913	Ohio River and tributaries	467	147,000
December 1913	Texas rivers	177	9,000
June 1915	Kansas River	---	5,950
August 1916	Rivers of the Carolinas	---	21,700
June 1921	Arkansas River in State of Colorado	120	25,000
September 1921	Texas rivers	215	19,000
October 1923	Lower Arkansas, including the State of Oklahoma	---	15,000
March 1924	Potomac River	---	6,000
Spring of 1927	Mississippi Valley	313	284,118
November 1927	New England rivers	88	45,578
December 1933	Columbia River and tributaries	---	10,000
May 1935	Rivers in eastern Colorado	---	6,000
May-June 1935	Republican and Kansas Rivers	110	18,000
	Lower Missouri River	---	10,000
July 1935	Upper Susquehanna tributaries	52	26,000
December 1935	Houston, Texas area	---	2,500
March-April 1936	Rivers in eastern United States	107	270,000
Jan.-Feb. 1937	Ohio and lower Mississippi River basins	137	417,685
December 1937	Sacramento Valley	---	7,100
March 1938	Streams in southern California	79	24,500
September 1938	Rivers in New England	---	37,000
July 1939	Licking and Kentucky Rivers	78	1,715
Feb.-Mar. 1940	Sacramento Valley	---	6,700
August 1940	Rivers in southern Virginia, the Carolinas, and eastern Tennessee	40	12,000
Oct.-Nov. 1941	Arkansas River basin	---	8,500
April-June 1942	Upper Mississippi, Missouri, Arkansas, Red, and Trinity River basins	---	44,350
May 1942	Delaware & Susquehanna River basins	33	13,000
July 1942	Upper Allegheny River and Sennemahoning Creek basins	15	10,000
Nov.-Dec. 1942	Willamette River	10	6,900
Dec. 1942-Jan. 1943	Ohio River	---	10,540
Apr.-June 1943	Maumee, Wabash, upper Mississippi, Missouri, White, and Arkansas River basins	60	172,500
August 1943	Little Kanawha	23	1,300
April-June 1944	Upper Mississippi, Missouri, Arkansas, Red, lower Mississippi Basins and east Texas Streams	17	82,000
Feb.-Mar. 1945	Ohio River	18	30,000
Feb.-Apr. 1945	Trinity and Sabine Rivers	---	9,000
Mar.-July 1945	Lower Mississippi River	---	9,500
July 1945	Lake Section of Rensselaer County, N. Y.	---	3,500
December 1945	Willamette River	---	6,000
January 1946	Cumberland River	---	3,925
September 1946	San Antonio and Nueces Rivers	---	6,050
December 1946	Willamette River	---	5,525
April 1947	Allegheny	---	4,319
May-July 1947	Rivers in middle West in the lower Missouri and middle Mississippi River basins	29	235,000
June 1947	East Creek at Rutland, Vt.	---	2,000
Apr.-May 1948	Red River of North and tributaries	---	18,700
May-June 1948	[1]Columbia Basin	35	101,725
June-July 1948	Arkansas River and minor tributaries	---	14,500
December 1948	Housatonic River	---	4,200

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS
YEAR 1971

Elmer R. Nelson, Office of Hydrology

The most damaging flood in the nation during 1971 occurred in New Jersey during August and September.

The floods during August were due to excessive rainfall accompanying Tropical Storm Doria. The flooding was the most severe in the central portion of New Jersey. The total damages were estimated at $138.5 million and the number of deaths were placed at three.

Damaging floods occurred in New Jersey and the adjacent area of southeastern Pennsylvania during September. This was the second consecutive month that severe floods occurred in this area. The total damages were estimated at $80 million to $100 million with 14 deaths.

This report contains a brief summary, by months of the most significant flooding during 1971. A detailed summary of the flooding appears in the monthly issues of this publication.

JANUARY

Major flooding occurred along coastal streams in southwestern Oregon during January. The most severe flooding was on the Coquille River which remained above flood stage for 5 days. The Rogue and Umpqua Rivers crested 5 to 10 feet above flood stage. The Geological Survey reported that the peak discharges of some streams were the highest for January in more than 60 years. Damage due to the high water was confined mostly to siltation and debris.

Severe flooding occurred in the Chehalis Basin in southwestern Washington. This was the most severe flood since 1937. The peak of 40, 100 c.f.s., at Grand Mound, Wash., USGS gage was the third highest on record. Considerable farmland, numerous roads, many homes and a number of motels and business establishments were flooded. Preliminary damage estimates by the Corps of Engineers were placed at $1 million.

FEBRUARY

The most significant flooding during February occurred in western Iowa, western Missouri, and northeastern Nebraska. Record flooding occurred on Brazile Creek at Niobrara, Nebr., and on the North Branch of the Elkhorn River at Pierce, Nebr. Many other places along creeks and streams reported near record crests. Many communities without gages or records indicated the highest water in memory. Unprecedented lowland flooding occurred along the Elkhorn and other portions of the North Branch. The damages were estimated at $5 million.

Major flooding occurred along the Maquoketa and Wapsipinicon Rivers in Iowa, the Pecatonica River in Wisconsin and Illinois. Record stages were reached on the lower Rock at Joslin and Moline, Ill. The highest stage in the last 20 years was reported on the Nishnabotna River at Hamburg, Iowa.

MARCH

Moderate to severe flooding occurred in some areas in the South Atlantic and East Gulf of Mexico Drainages during March. Flooding on the Ocmulgee River at Macon, Ga., was of record proportions. The Oconee River at Milledgeville, Ga., reached its highest level since 1886. No major damages resulted from the record to near record stages. The highest flooding since October 1964 occurred along the Rocky River at Norwood, N. C., and the highest flooding in a number of years occurred on the Lynches River at Effingham, N. C. The Black River at Kingstree, S. C., rose within 1 foot of the 1945 flood level. Major flooding occurred along the Pee Dee, lower Broad, and Congaree Rivers in South Carolina. The Pee Dee River rose over 18 feet within 24 hours at Cheraw, S. C., equalling the August 1970 flood. Moderate to heavy flooding occurred on the Savannah and Ogeechee Rivers in Georgia.

The most extensive flooding since 1964 occurred in Alabama during March. Major floods occurred on the Alabama and Tallapoosa Rivers with all points exceeding flood stages by several feet. About 25 families were evacuated in the Montgomery area.

APRIL

Widespread flooding occurred along the Pembina River during April as water inundated 25,000 to 35,000 acres of agricultural lands in Canada and North Dakota. Most of the flooding was on the American side of the border. Dikes, built in past years, and enlarged this year, held off flood waters from the Pembina River in Walhalla and Neche, N. Dak., which cut through low-lying land and park areas. The biggest threat along the river was to Neche, N. Dak., where an intensive flood fight saved the town from the highest crest of record, 22.22 feet. The total flood damages and cost of protection measures in the Red River of the North Basin were estimated at $1.2 million. Of this total, $904,000 occurred in the Pembina Basin.

MAY

Near record flooding occurred over the lower Saline River in Kansas during May. This was the first significant overflow in the lower Saline River since May 1961. Major overflows occurred over the lower Republican River, the Little Blue River of Kansas, and several tributaries in north-central Kansas. The flooding on the lower Republican was the highest since May 1961. Considerable agricultural damage resulted from the overflows.

Major ice-jam flooding occurred in southwest Alaska toward the end of May. Many of the inhabitants in the eastern half of Bethel, Alaska, were forced to leave due to high water on the Kuskokwim River. Most of the residents of Napakiak, Oscaiville, and Napaiskak were evacuated.

JUNE

Extensive flooding occurred along the Nueces River from below Crystal City, Tex., to below Cotulla, Tex., during the latter part of June. Major flooding occurred at Cotulla, with a crest on July 1 ranking as the third highest of record.

Moderate to severe flooding occurred in the Shenandoah Basin in Virginia and West Virginia during the latter part of May and the first part of June. The stages in the lower Shenandoah were the highest since 1955.

Serious flooding occurred in Alaska on the lower Yukon, Kuskokwim, and Kobuk Rivers due to ice jams and greater than normal snowpack. The Yukon River near Ruby, Alaska, exceeded the previous maximum stage of 1963.

JULY

Numerous flash floods were reported throughout the

nation during July. The most damaging flash floods occurred in central and eastern Kentucky during the middle of the month. Flood damages were estimated in excess of $3.3 million. The threat to Cave Run's Coffer Dam necessitated the evacuation of 1,500 people from their homes. Flash flooding forced the evacuation of around 50 homes in Morgan, Carter, and McGoffin Counties.

AUGUST

The most damaging floods during August occurred in New Jersey from the heavy rains accompanying Tropical Storm Doria. This flood was the most damaging throughout the Raritan River Basin and the Assunpink Creek in central New Jersey. The communities hardest hit were Bound Brook, Raritan, Green Brook, Lodi, Manville, and Elizabeth, N. J. Power failures, road washouts, homes flooded, and evacuations were widespread throughout Bucks County, Pa., and New Jersey except the northwest hills and the coastal sections of New Jersey. The total damages were estimated at $138.5 million and the total number of deaths was placed at three.

Severe flooding occurred in Baltimore, Md., and the counties of Baltimore and Harford during the first 2 days of August. These flash floods resulted in 16 deaths and property damage estimated at $1 million.

SEPTEMBER

The most destructive flooding during September occurred in New Jersey and southeastern Pennsylvania. This was the second consecutive month that the most damaging floods in the nation occurred in this area. Record flooding occurred in Wissahickon, Cobbs, and Chester Creeks in the Philadelphia, Pa., area. In north New Jersey, the Pascack Brook at Westwood and Saddle River at Lodi reported record gage heights. The Philadelphia, Chester, Delaware, Bucks, and Montgomery Counties of southeastern Pennsylvania and Bergen, Passaic, Essex, and Union Counties of northeastern New Jersey reported heavy damages and record stages. The total damages were estimated at $80 million to $100 million. Eleven deaths were reported in southeastern Pennsylvania and three deaths in New Jersey.

OCTOBER

Widespread flooding, some serious, was reported along small streams, tributaries, and the main steam of the Appomattox River in Virginia during October. The stages along the Appomattox River at Farmville, Va., and at Mattoax, Va., were exceeded only by the 1940 flood. At Deep Creek, the water level exceeded the 1940 stage by 4.7 feet.

Extensive flash flooding occurred on San Diego Creek at San Diego and Alice, Tex., during the middle of October. Two hundred families were flooded out of their homes and one drowning was reported. Alice, Tex., was nearly isolated. Heavy flooding occurred on Spring and Ramirena Creeks, tributaries to the lower Nueces. Major flooding occurred along the extreme lower Nueces.

NOVEMBER

Major flooding occurred along the lower reaches of the Pee Dee River in South Carolina during the first part of November. The flooding, however, was much less severe than during the previous 3 months.

Major flooding occurred on the extreme lower Nueces River in Texas during early November due to excessive rains during mid-October.

Significant flooding occurred on tributaries of the Arkansas River in the southwest quadrant of Kansas during mid-November. The Coon Creek tributaries flooded as much as one-half of Kinsley, Kans., with water up to 1 foot or more deep.

DECEMBER

Major flooding occurred on tributaries of the Arkansas River in northeastern and extreme eastern Oklahoma during December. The Poteau River at Panama, Okla., rose nearly 15.5 feet above flood stage, the fourth highest stage on record. Bird Creek and Pole Cat Creek crested 1 to 1.5 feet lower than the September 1971 flood. The Arkansas River experienced the most flooding since completion of the Arkansas River Navigation Project. Flood damages were heavy and estimated at nearly $16 million.

The flooding along the East Fork of the Trinity River near Crandall, Tex., was the second highest since records began in 1949.

Serious flooding and landslides occurred in southern California during the latter part of December. Many major highways were closed by the mudslides or high water. Several homes along Santa Monica Creek and Franklin Creek were flooded. The hardest hit area was Santa Barbara County where the damages were estimated at $3.5 million.
